2025 ACC/AHA/ACEP/NAEMSP/SCAI Guideline for the Management of Patients With Acute Coronary Syndromes

A Report of the American College of Cardiology/American Heart Association Joint Committee on Clinical Practice Guidelines

Recommendation for Use of Intracoronary Imaging
Referenced studies that support recommendation are summarized in the [Evidence Table](#).

COR	LOE	RECOMMENDATION
1	A	1. In patients with ACS undergoing coronary stent implantation in left main artery or in complex lesions, intracoronary imaging with intravascular ultrasound (IVUS) or optical coherence tomography (OCT) is recommended for procedural guidance to reduce ischemic events.* ¹⁻¹¹

*Adapted from the "2021 ACC/AHA/SCAI Guideline for Coronary Artery Revascularization."¹²

European Heart Journal (2024) 00, 1–123
<https://doi.org/10.1093/eurheartj/ehae177>

ESC GUIDELINES

2024 ESC Guidelines for the management of chronic coronary syndromes

Developed by the task force for the management of chronic coronary syndromes of the European Society of Cardiology (ESC)

Endorsed by the European Association for Cardio-Thoracic Surgery (EACTS)

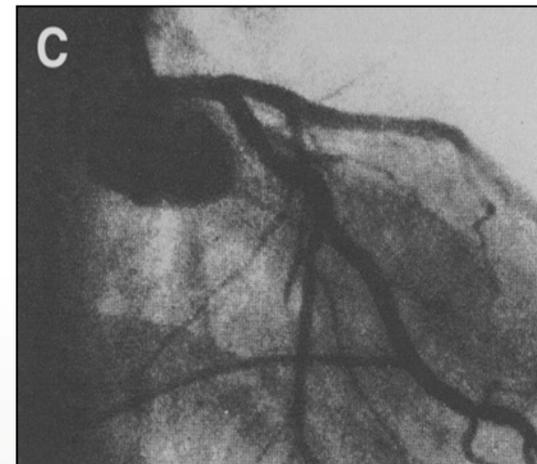

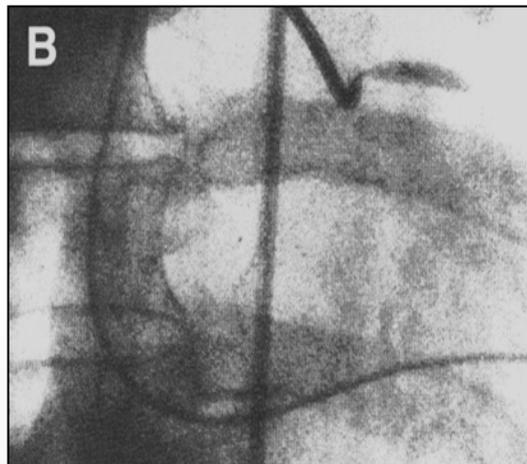

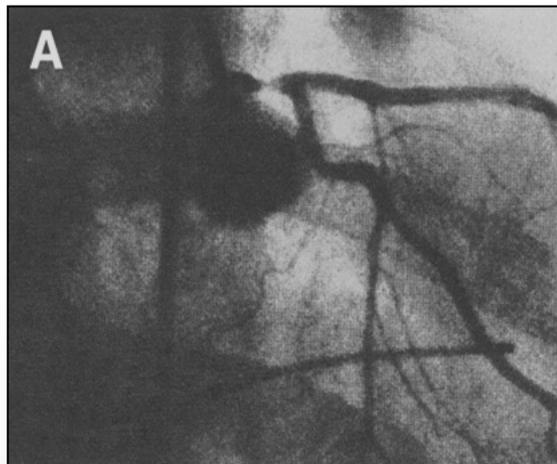

Assessment of procedural risks and post-procedural outcomes

In patients with complex CAD in whom revascularization is being considered, it is recommended to assess procedural risks and post-procedural outcomes to guide shared clinical decision-making.	I	C
Calculation of the STS score is recommended to estimate in-hospital morbidity and 30-day mortality after CABG. ^{777,862–864}	I	B
In patients with multivessel obstructive CAD, calculation of the SYNTAX score is recommended to assess the anatomical complexity of disease. ^{786,865}	I	B
Intracoronary imaging guidance by IVUS or OCT is recommended when performing PCI on anatomically complex lesions, in particular left main stem, true bifurcations, and long lesions. ^{866,337,810,840,841}	I	A

1977

First PCI of Left Main in The World.

“Third PCI patient ever treated. Forty-three year old man with severe angina pectoris since September, 1977 First angiogram (November 11) revealed severe stenosis of the main L.C.A. . .”

Gruntzig A. Lancet 1978;1:263

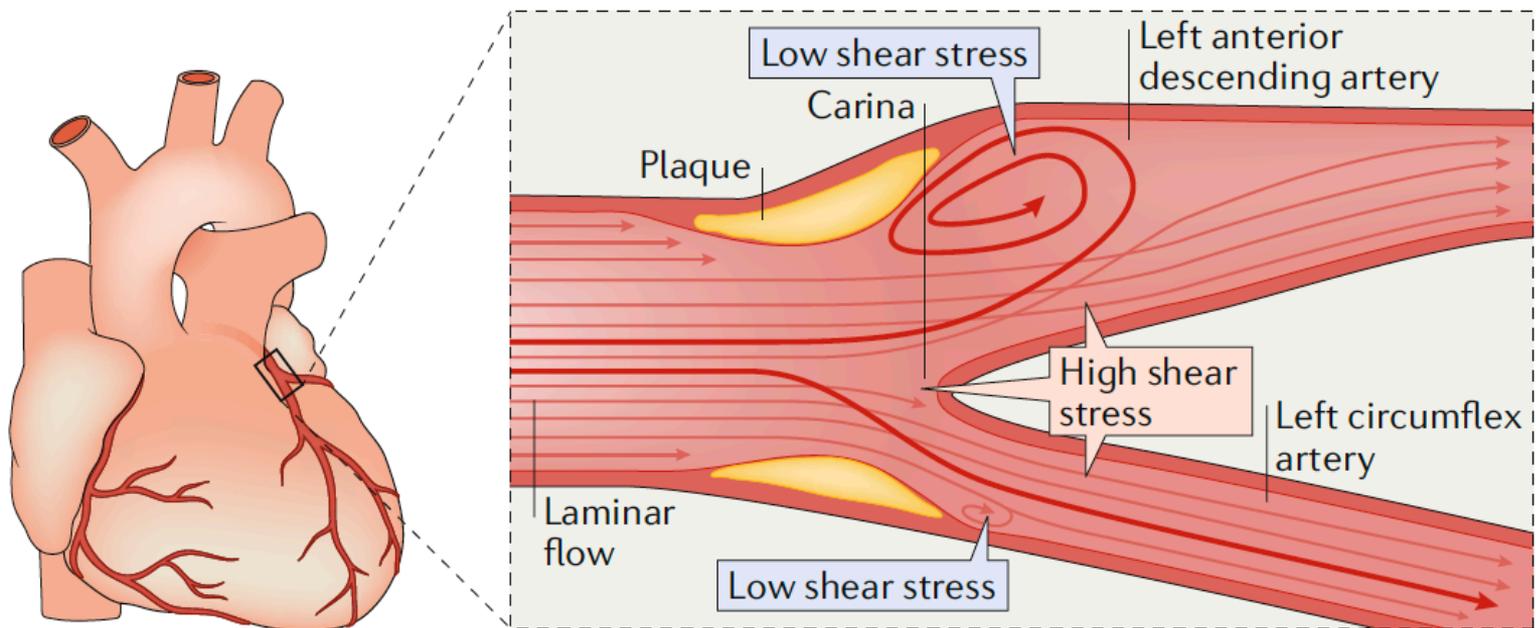

Importance reminder:

LM disease occurs in 5-7% of patients undergoing
coronarography:

LM supplies 84% (or 100%) of blood to the LV

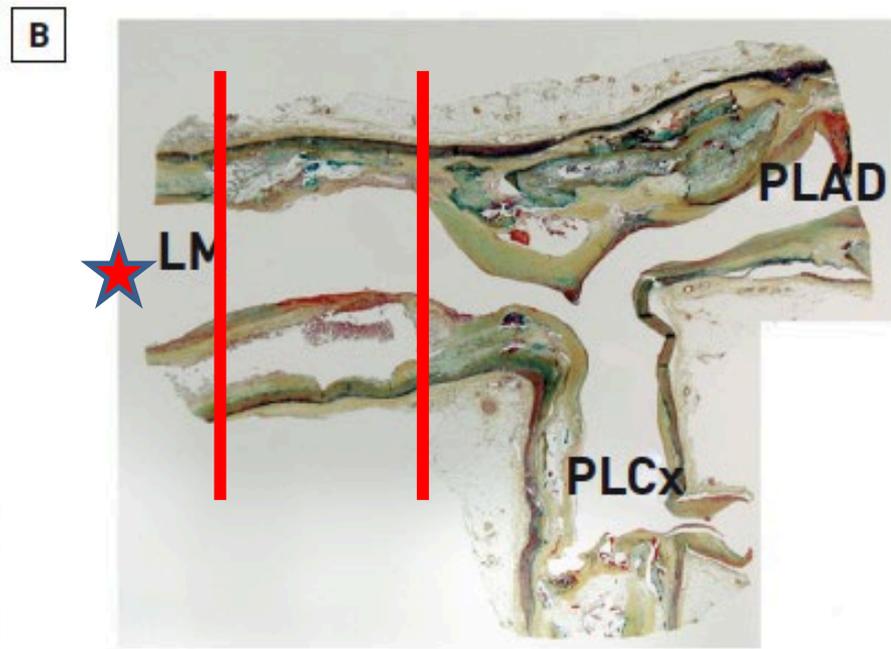

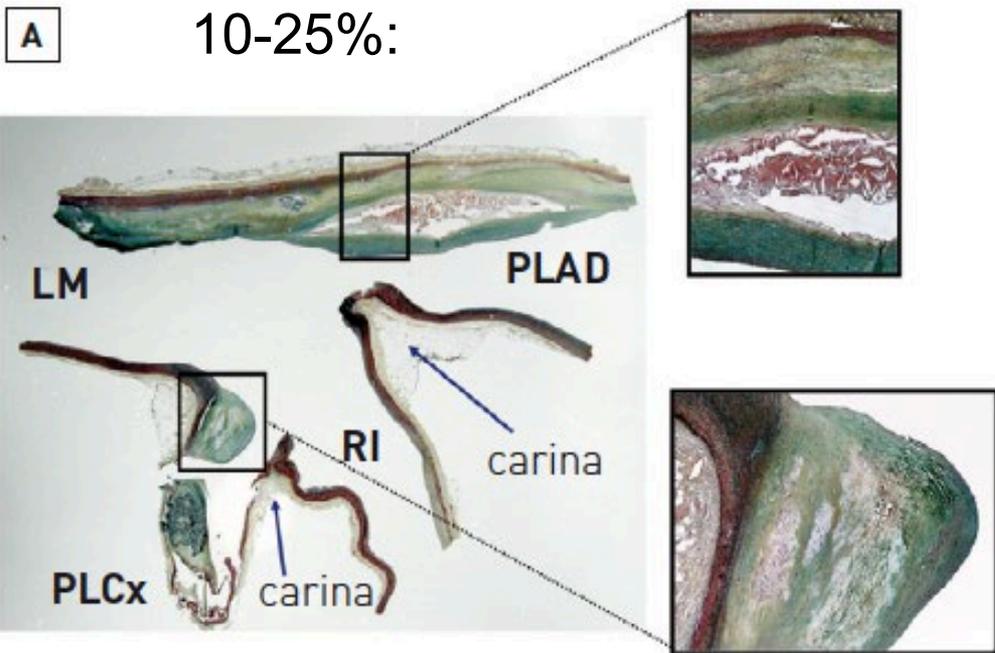

Medical treatment of ULMCA =
3-year mortality of 50%

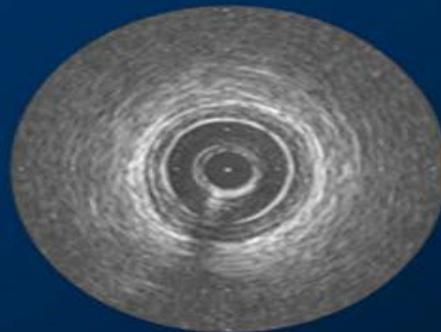

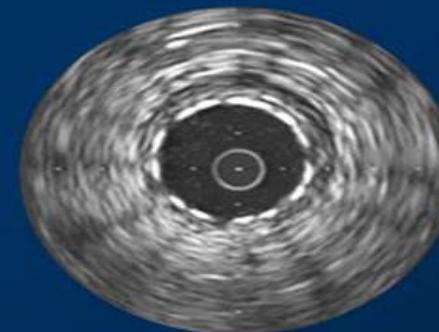

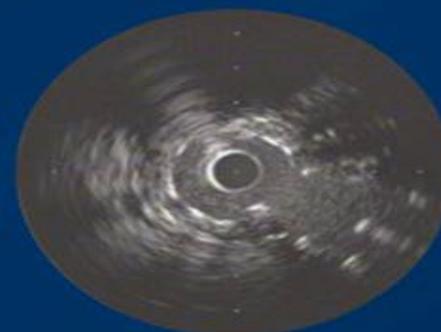

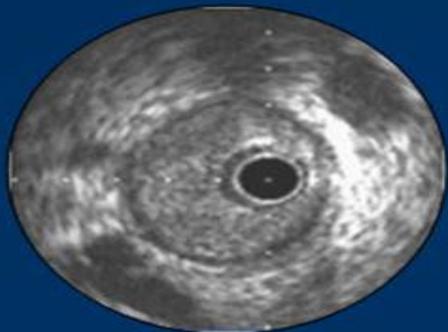

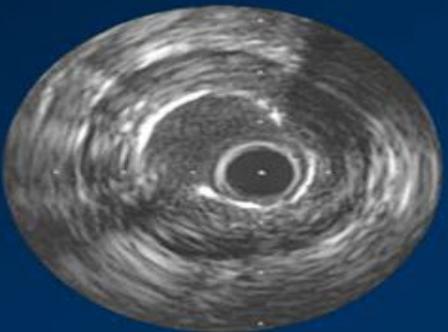

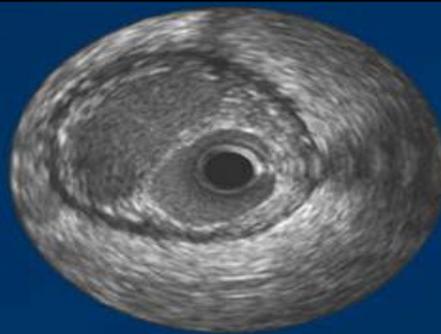

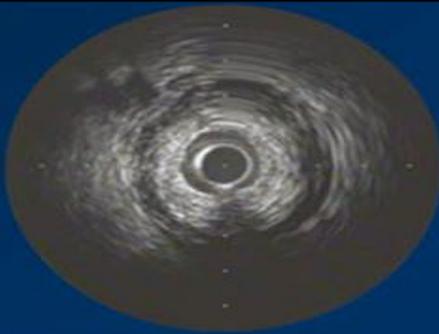

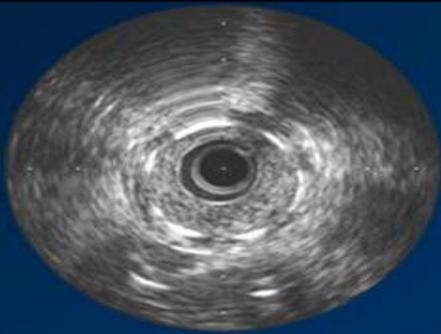

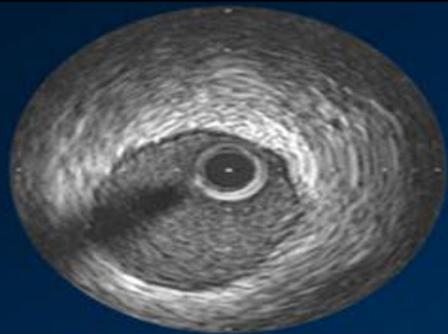

Anatomy and pathophysiology

Length: 10.8 ± 5.2 mm (range 2 to 23 mm). Diameter: 4.9 ± 0.8 mm, Angle of the terminal division: $86.7 \pm 28.8^\circ$ (range 40° to 165°)

Anatomy and pathophysiology

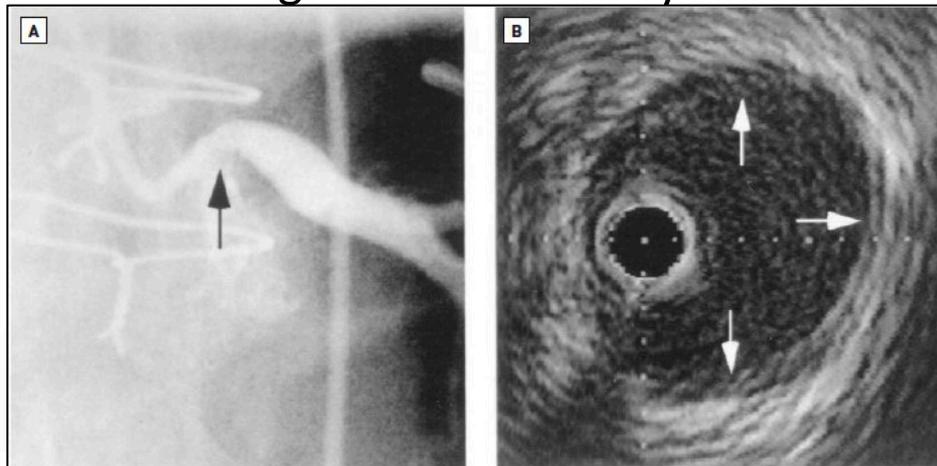

IVUS in LM PCI

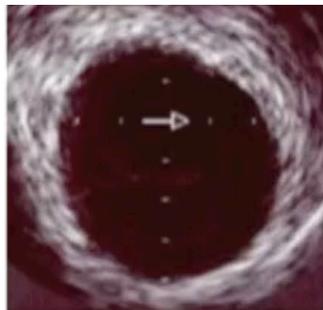

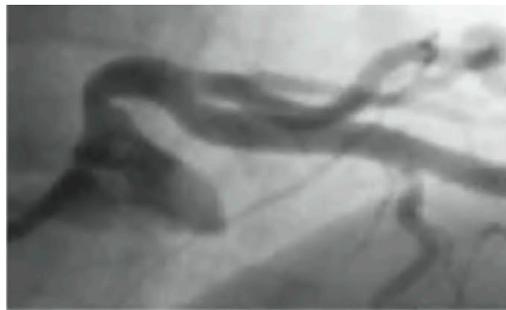

LM is the vessel with the greatest variability between angio and IVUS.

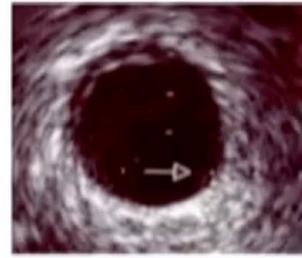

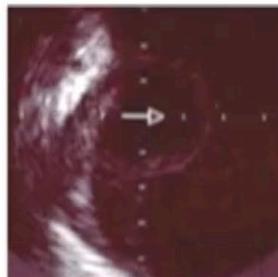

Recommendation for Intravascular Ultrasound to Assess Lesion Severity

Referenced studies that support the recommendation are summarized in [Online Data Supplement 6](#).

COR	LOE	RECOMMENDATION
2a	B-NR	1. In patients with intermediate stenosis of the left main artery, intravascular ultrasound (IVUS) is reasonable to help define lesion severity (1-5).

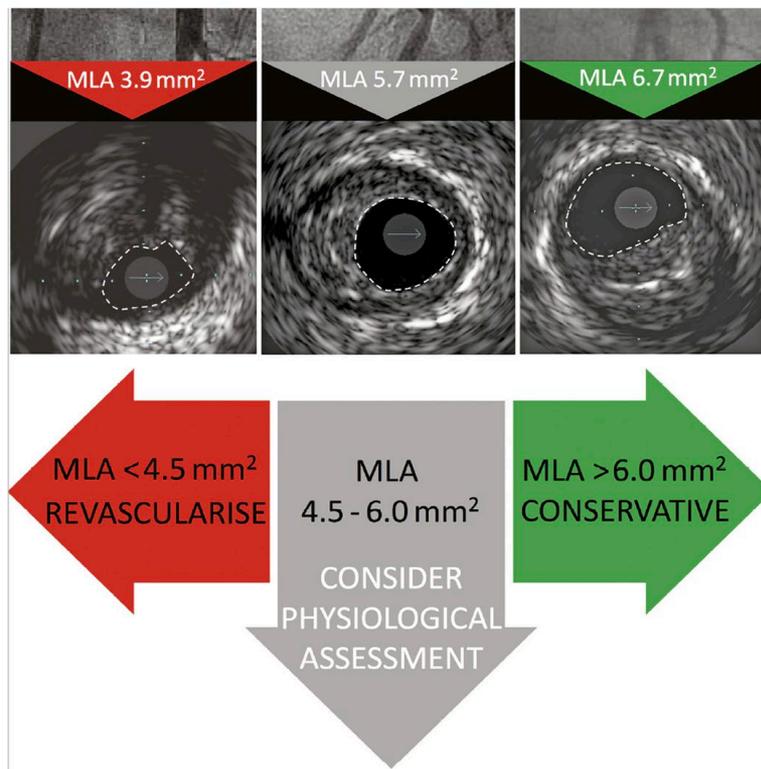

IVUS = No disease (angio artifacts) = No PCI

IVUS in LM PCI: evaluation

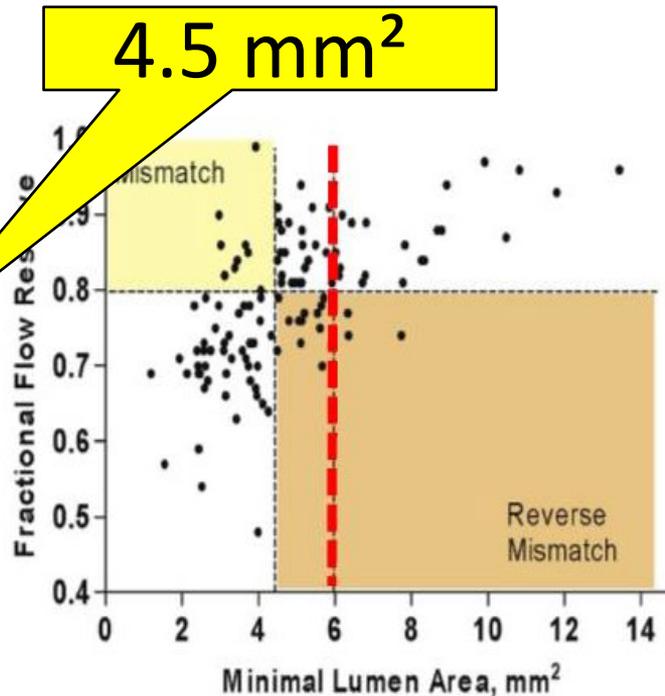

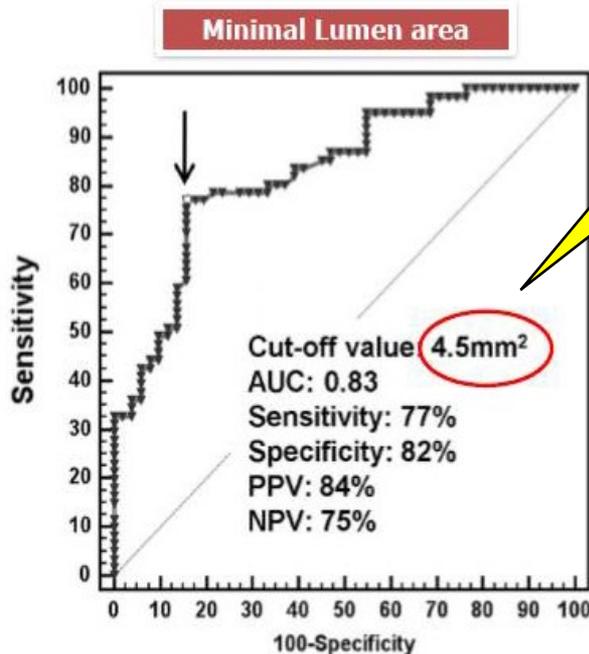

- Johnson TW, Räber L, Di Mario C, Bourantas CV, Jia H, Mattesini A, Gonzalo N, de la Torre Hernandez JM, Prati F, Koskinas KC, Joner M, Radu MD, Erlinge D, Regar E, Kunadian V, Maehara A, Byrne RA, Capodanno D, Akasaka T, Wijns W, Mintz GS, Guagliumi G. Clinical use of intracoronary imaging. Part 2: acute coronary syndromes, ambiguous coronary angiography findings, and guiding interventional decision-making: an expert consensus document of the European Association of Percutaneous Cardiovascular Interventions. *EuroIntervention*. 2019 Aug 29;15(5):434-451. doi: 10.4244/EIJY19M06_02. PMID: 31258132.

IVUS-Derived Minimal Lumen Area Criteria for Functionally Significant Left Main Coronary Artery Stenosis

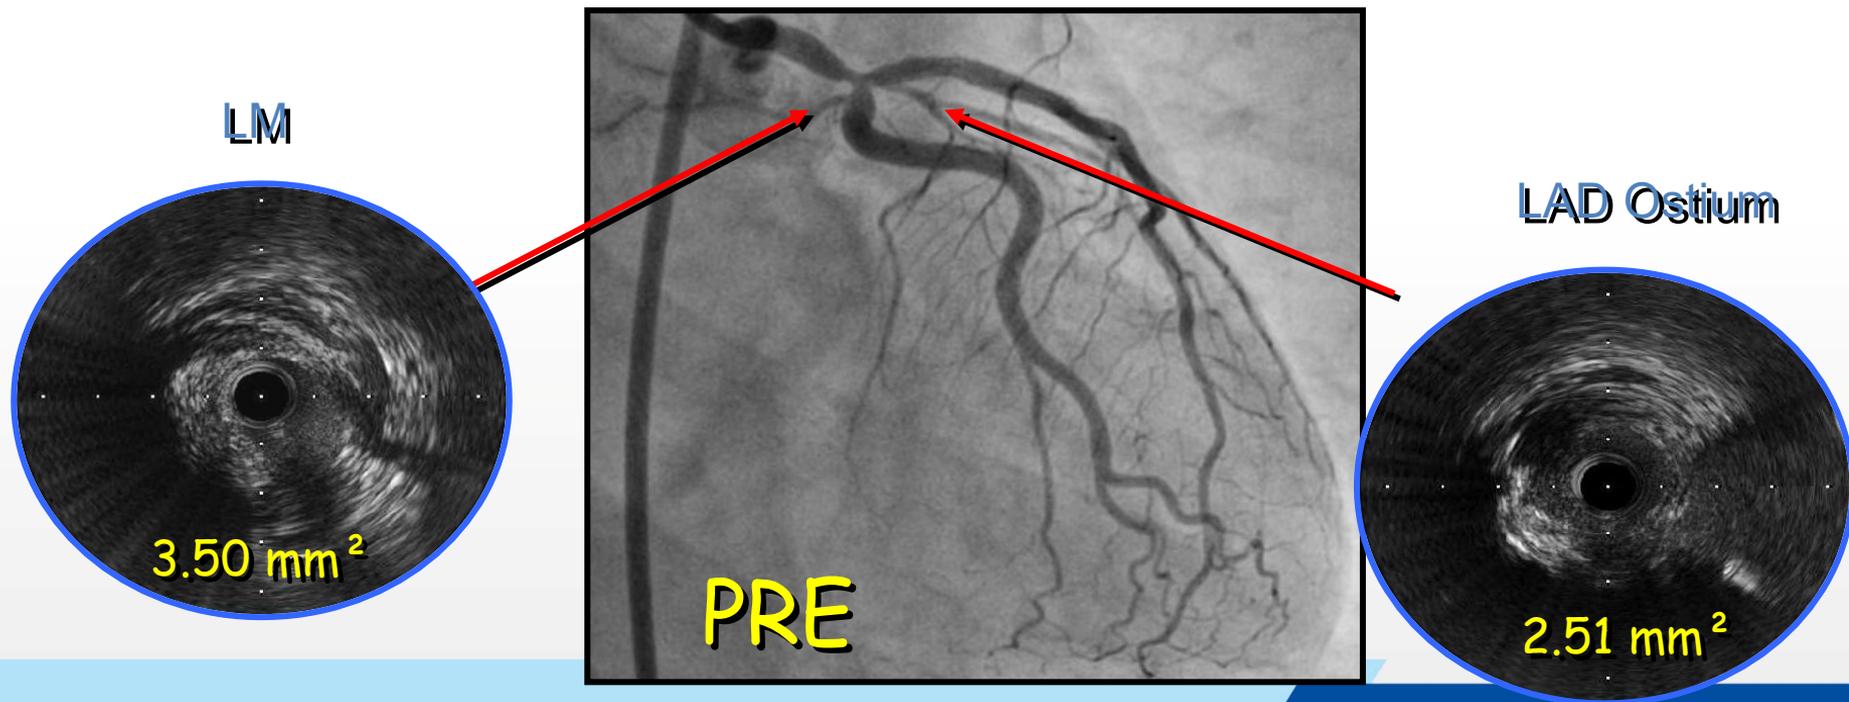

112 patients with isolated ostial and shaft intermediate LMCA stenosis (angiographic diameter stenosis of 30% to 80%) who underwent IVUS and FFR measurement.

Evidence: PCI vs CABG for LM

Study	Study population	Primary endpoint	Follow-up	Findings
PRECOMBAT (non-inferiority) ⁸¹⁴	600 patients with newly diagnosed LMCAD who had stable angina, unstable angina, silent ischaemia, or non-ST-segment elevation MI	All-cause death, MI, stroke, or ischaemia-driven target vessel revascularization	2 years	1-year follow-up: 8.7% and 6.7% primary endpoints for PCI and CABG, respectively, absolute risk difference 2% (95% CI, -1.6% to 5.6%), $P = .01$ for non-inferiority 2-year follow-up: 12.2% and 8.1% primary endpoints for PCI and CABG, respectively, HR 1.50 (95% CI, 0.90–2.52), $P = .12$
PRECOMBAT (extended follow-up) ⁸¹⁵			5 years	17.5% and 14.3% primary endpoints for PCI and CABG, respectively, HR 1.27 (95% CI, 0.84–1.90), $P = .26$
PRECOMBAT (extended follow-up) ⁸¹⁶			11.3 years (median)	29.8% and 24.7% primary endpoints for PCI and CABG, respectively, HR 1.25 (95% CI, 0.93–1.69)
SYNTAX ⁸¹⁷	1800 patients with <i>de novo</i> three-vessel ($n = 1095$) and LMCAD ($n = 795$)	All-cause death, stroke, MI, and repeat revascularization	1 year	For the LMCAD group: 15.8% and 13.7% primary endpoints for PCI and CABG, respectively; $P = .44$
SYNTAX ⁸¹⁸			3 years	For the LMCAD group: 26.8% and 22.3%, primary endpoints for PCI and CABG, respectively; $P = .20$
SYNTAX ⁸¹³			5 years	For the LMCAD group: 36.9% and 31.0% primary endpoints for PCI and CABG, respectively, HR 1.25 (95% CI, 0.93–1.69), $P = .12$
SYNTAX (extended follow-up) ⁷⁹⁵		All-cause death	10 years	For the LMCAD group: 27% and 28% primary endpoints for PCI and CABG, respectively, HR 0.92 (95% CI, 0.69–1.22)
NOBLE (non-inferiority hypothesis) ⁸¹⁹	1201 patients with LMCAD who had stable angina pectoris, unstable angina pectoris, or non-ST-segment elevation myocardial infarction	All-cause death, non-procedural MI, any repeat coronary revascularization, or stroke	3.1 years (mean)	28% and 18% primary endpoints for PCI and CABG, HR 1.51 (95% CI, 1.13–2.00), $P = .004$ for superiority
NOBLE (extended follow-up) ⁸²⁰			4.9 years (median)	28% and 19% primary endpoints for PCI and CABG, HR 1.58 (95% CI, 1.24–2.01), $P < .001$ for superiority
EXCEL (non-inferiority hypothesis) ⁸²¹	1905 patients with LMCAD of low or intermediate anatomical complexity (SYNTAX score ≤ 32)	All-cause death, stroke, or MI	3 years (median)	15.4% and 14.7% primary endpoints for PCI and CABG, absolute risk difference 0.7% (upper 97.5% confidence limit: 4%), $P = .02$ for non-inferiority; HR 1.00 (95% CI, 0.79–1.26), $P = .98$ for superiority
EXCEL (extended follow-up) ⁸²²			5 years	22.0% and 19.2% primary endpoints for PCI and CABG, absolute risk difference 2.8% (95% CI, -0.9 to 6.5), $P = .13$; OR 1.19 (95% CI, 0.95–1.50)

Anatomically and clinically based recommendations for revascularization in CCS	Class^a	Level^b
Left main disease		
In CCS patients at low surgical risk ^c with significant left main coronary stenosis, CABG:		
• is recommended over medical therapy alone to improve survival; ⁷¹⁹	I	A
• is recommended as the overall preferred revascularization mode over PCI, given the lower risk of spontaneous myocardial infarction and repeat revascularization. ^{728,730,782}	I	A
In CCS patients with significant left main coronary stenosis of low complexity (SYNTAX score ≤ 22), in whom PCI can provide equivalent completeness of revascularization to that of CABG, PCI is recommended as an alternative to CABG, given its lower invasiveness and non-inferior survival. ^{718,728,730,802,813}	I	A
In CCS patients with significant left main coronary stenosis of intermediate complexity (SYNTAX score 23–32), in whom PCI can provide equivalent completeness of revascularization to that of CABG, PCI should be considered, given its lower invasiveness and non-inferior survival. ^{718,728,730,802,805,809,813,820,822}	Ila	A

Assessment of procedural risks and post-procedural outcomes

In patients with complex CAD in whom revascularization is being considered, it is recommended to assess procedural risks and post-procedural outcomes to guide shared clinical decision-making.	I	C
Calculation of the STS score is recommended to estimate in-hospital morbidity and 30-day mortality after CABG. ^{777,862-864}	I	B
In patients with multivessel obstructive CAD, calculation of the SYNTAX score is recommended to assess the anatomical complexity of disease. ^{786,865}	I	B
Intracoronary imaging guidance by IVUS or OCT is recommended when performing PCI on anatomically complex lesions, in particular left main stem, true bifurcations, and long lesions. ^{866,337,810,840,841}	I	A

Intracoronary pressure measurement (FFR or iFR) or computation (QFR) :

• is recommended to guide lesion selection for intervention in patients with multivessel disease; ^{308,826,866,867}	I	A
• should be considered at the end of the procedure to identify patients at high risk of persistent angina and subsequent clinical events; ^{828,830,831,868}	IIa	B
• may be considered at the end of the procedure to identify lesions potentially amenable to treatment with additional PCI. ^{350,829,831}	IIb	B

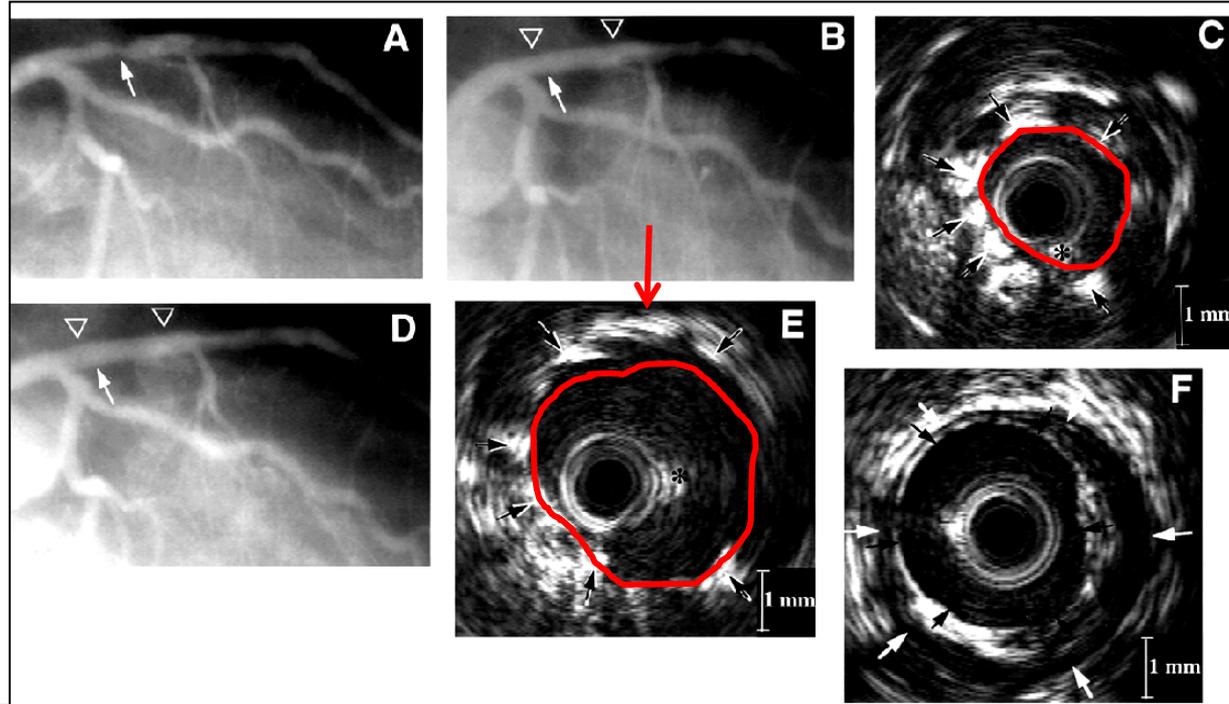

Impacto del IVUS en la ATC

Corrección de los 3 principales mecanismos de falla de la ATC con DES: subexpansión del stent, aposición incompleta de struts en la pared arterial y cobertura incompleta de la placa arteriosclerótica.

- Aumento del diámetro del stent o balón (38%)
- Mayor presión durante la póst dilatación con balón (23%)
- Selección de stents más largos (22%)
- Póst dilatación com balón para corregir subexpansión (13%)
- Póst dilatación com balón para mala aposición de struts (8%)
- Implante de stent adicional (7%)

Intracoronary Stenting Without Anticoagulation Accomplished With Intravascular Ultrasound Guidance

Antonio Colombo, MD; Patrick Hall, MD; Shigeru Nakamura, MD; Yaron Almagor, MD; Luigi Maiello, MD; Giovanni Martini, CCP; Antonio Gaglione, MD; Steven L. Goldberg, MD; Jonathan M. Tobis, MD

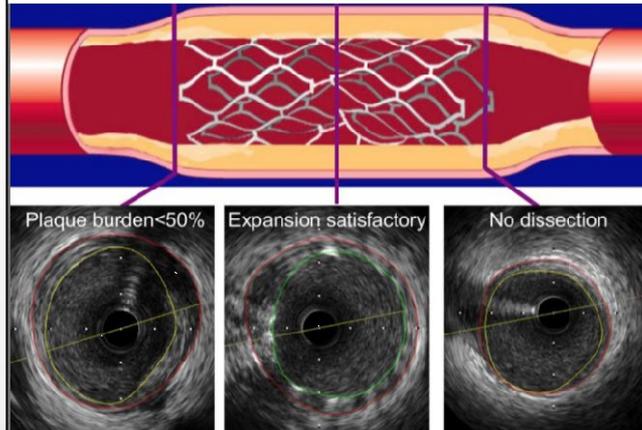

Despite this aggressive inflation approach, 40% of the stents with an acceptable angiographic result still required additional dilatation with higher pressures or, less commonly, a dilatation with a larger balloon

RESUMEN

Introducción: La cirugía de revascularización miocárdica es el tratamiento convencional para pacientes (p) con lesión de tronco de coronaria izquierda no protegido (TCINP). La Angioplastia Transluminal Coronaria (ATC) con stents liberadores de droga (DES) es una opción factible, con bajas tasas de revascularización debido a reestenosis de la lesión tratada, y con mortalidad similar a la cirugía. **Objetivo:** Evaluar la efectividad de ATC con DES optimizada por ultrasonido intracoronario (IVUS) en pacientes con enfermedad de TCINP.

Métodos: registro prospectivo consecutivo de p con lesión de TCINP tratados con ATC con DES guiada por IVUS. Se consideraron eventos combinados de muerte, infarto de miocardio, accidente cerebro-vascular (ACV) o revascularización de lesión tratada (RVT).

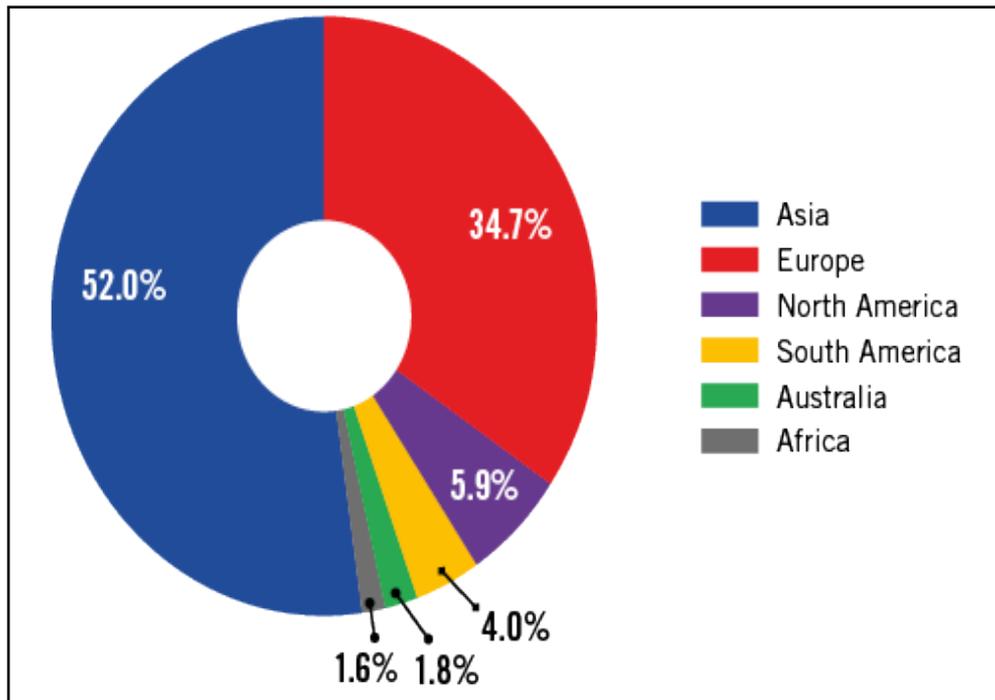

Resultados: 24 p, edad media 65,7±12,1 años; sexo masculino 83%, diabetes 21%. Enfermedad multi-vaso 88%. Lesión calcificada 13,6%. Fueron implantados 1,5 ± 0,85 stents/paciente. Syntax Score < 22 en 66,6%, 23-32 en 29,1%. Lesiones en bifurcaciones 87%. Implantados con técnica de stent provisional 77,3%. Area luminal media del DES 9,3 mm². Re-intervención con balón por hipoxpansión y/o falta de aposición en p (33,3%). Evolución intra-hospitalaria: 1 p infarto sub-clínico (4,1%). Seguimiento promedio 283 ± 63 días: 1 p IAM secundario a trombosis tardía de stent (2,7%). Mortalidad y ACV intrahospitalaria y alejada 0%.

Conclusiones: la ATC con DES optimizada con la guía de IVUS en lesiones de TCI NP en nuestra experiencia es un procedimiento seguro, con baja incidencia de complicaciones mayores intra-hospitalaria y alejadas, por lo que puede ser considerado una alternativa a la cirugía de revascularización miocárdica.

El pac

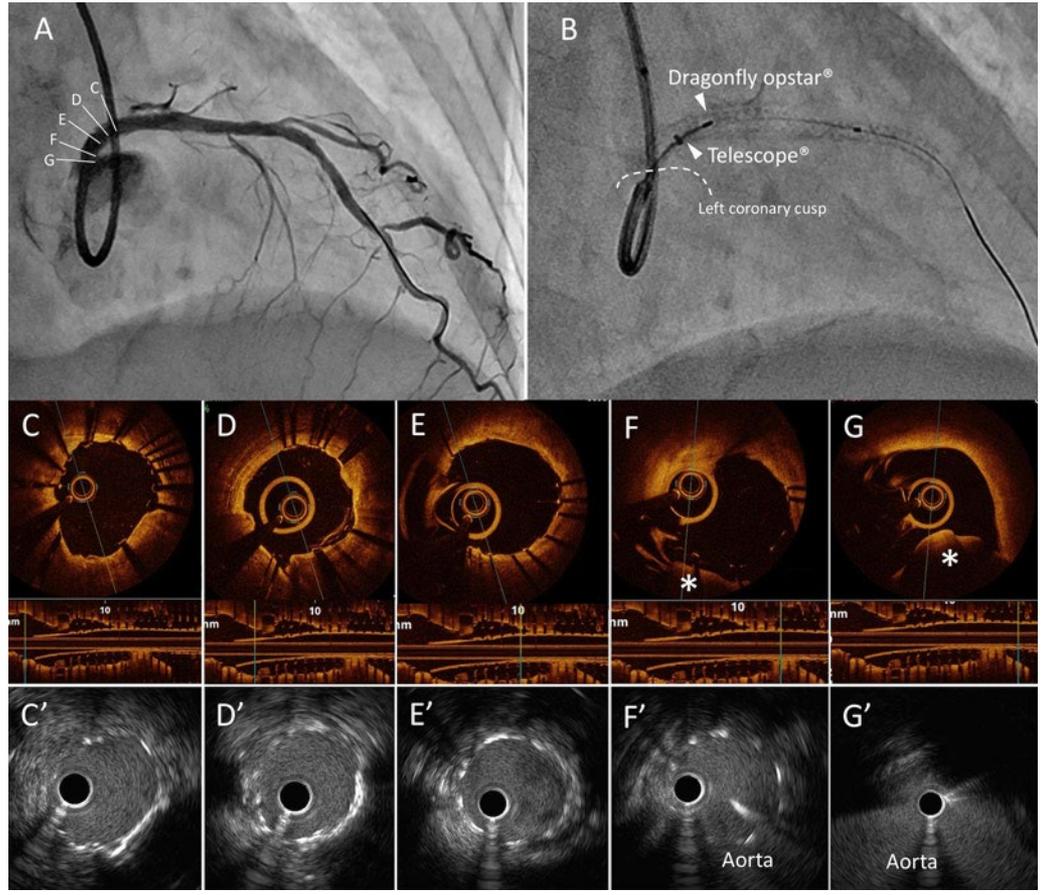

No existe una ventaja entre una modalidad y la otra: en términos de mejorar los resultados.

IVUS no requiere el uso de contraste para obtener la imagen.

OCT tiene una mejor resolución espacial, generando imágenes de mayor calidad y más fáciles de interpretar (más intuitiva que la IVUS).

OCT presenta cierta dificultad para adquirir imágenes en ciertos escenarios: OTC, lesiones aortoostiales (factible, pero desafiante), grandes disecciones agudas, etc.

Observing an aorto-ostial lesion using TELESCOPE® in optical coherence tomography-guided percutaneous coronary intervention

Comentarios finales

- Angioplastias guiadas por imágenes (IVUS), produce cambios en resultados largo plazo, en PCI complejas, especialmente en reducir revascularización de la lesión tratada.
- Para obtener estos beneficios, las imágenes deberían ser correctamente interpretadas, y los operadores deberían reaccionar a los resultados del IVUS.
- Guía por IVUS para lesiones complejas y lesión de TCI. (**Clase I evidencia A**)
PRE intervención: evaluación vaso y características lesión
POST intervención: expansión del Stent, aposición y complicaciones agudas (disección).
- Desde el momento que tomó su decisión de darle el tiempo necesario para re evaluar su caso por IVUS, intente identificar las diferentes imágenes / complicaciones.

El paciente en el corazón de cada decisión

La tensión de cizallamiento endotelial es la fuerza tangencial derivada de la fricción del flujo sanguíneo sobre la superficie endotelial y es el producto de la velocidad de cizallamiento en la pared y la viscosidad sanguínea. En regiones arteriales con flujo laminar alterado, una tensión de cizallamiento endotelial baja modifica la función y la estructura endotelial hacia un fenotipo aterosclerótico, promoviendo así la aterogénesis, la formación y progresión de la placa aterosclerótica y la remodelación vascular (recuadro azul)²⁰, mientras que la carina está expuesta a una tensión de cizallamiento alta.

Efectos del bajo esfuerzo cortante

- Reducción de la producción de óxido nítrico y prostaciclina
- Aumento de la secreción de endotelina 1
- Promueve la captación, síntesis y permeabilidad del colesterol LDL
- Promueve el estrés oxidativo y la inflamación
- Promueve la migración, proliferación y diferenciación de las células musculares lisas vasculares
- Induce la degradación de la pared vascular y la capa fibrosa de la placa
- Atenúa la síntesis de la matriz extracelular en la pared vascular y la capa fibrosa de la placa
- Aumento de la neovascularización y calcificación de la placa
- Aumenta la trombogenicidad de la placa

LIMA, %	72	99	97	94	99	96
Off pump, %	1.9	46	Not reported	64	29	16
Primary trial endpoint	Change in LVEF	Cardiac death, MI, or TVR	Death, MI, stroke, or repeat revascularization 10-y all-cause death	Death, MI, stroke, or TVR	Death, MI, or stroke	Death, nonprocedural MI, stroke, or repeat revascularization
Key finding	There was a trend toward higher LVEF at 10 y with PCI.	PCI was inferior to CABG at 1 y.	PCI was noninferior to CABG at 1 and 5 y in terms of death, MI, stroke, or repeat revascularization. No significant difference in 10-y all-cause death between PCI and CABG.	PCI was noninferior to CABG at 1, 5, and 10 y.	PCI was noninferior to CABG at 3 and 5 y.	PCI was inferior to CABG at 5 y.

Embarking on LMCA PCI

- Imaging is the foundation of LMCA PCI
 - Can help with diagnosing significant LMCA disease as well
- Consider LV support
 - No strict guide- ongoing studies will help
- Access
 - 7F radial guide have changed the landscape
- Volume drives outcomes
- Imaging is key- did we say that already?
- Comfort with evaluation and treatment of bifurcations is mandatory
 - To be discuss later in session

Guidelines

Left main CAD		
1	B-R	3. In patients with SIHD and significant left main stenosis, CABG is recommended to improve survival (9-12).
2a	B-NR	4. In selected patients with SIHD and significant left main stenosis for whom PCI can provide equivalent revascularization to that possible with CABG, PCI is reasonable to improve survival (9).

2021 ACC/AHA/SCAI Guideline for Coronary Artery Revascularization

A Report of the American College of Cardiology/American Heart Association
Joint Committee on Clinical Practice Guidelines

Recommendations on criteria for the choice between coronary artery bypass grafting and percutaneous coronary intervention

Recommendations	Class ^a	Level ^b
Assessment of surgical risk^c		
It is recommended that the STS score is calculated to assess in-hospital or 30 day mortality, and in-hospital morbidity after CABG. ^{112,114,138}	I	B
Calculation of the EuroSCORE II score may be considered to assess in-hospital mortality after CABG. ¹¹²	IIb	B
Assessment of CAD complexity		
In patients with LM or multivessel disease, it is recommended that the SYNTAX score is calculated to assess the anatomical complexity of CAD and the long-term risk of mortality and morbidity after PCI. ^{117–124}	I	B
When considering the decision between CABG and PCI, completeness of revascularization should be prioritized. ^{131,132,134–136}	IIa	B

EuroSCORE = European System for Cardiac Operative Risk Evaluation; CABG = coronary artery bypass grafting; CAD = coronary artery disease; LM = left main; PCI = percutaneous coronary intervention; STS = Society of Thoracic Surgeons; SYNTAX = Synergy between Percutaneous Coronary Intervention with TAXUS and Cardiac Surgery.

^aClass of recommendation.

^bLevel of evidence.

^cLevel of evidence refers to prediction of outcomes.

Recommendation for the type of revascularization in patients with stable coronary artery disease with suitable coronary anatomy for both procedures and low predicted surgical mortality^d

Recommendations according to extent of CAD	CABG		PCI	
	Class ^a	Level ^b	Class ^a	Level ^b

© ESC 2018

SYNTAX score calculation information is available at <http://www.syntaxscore.com>.

CABG = coronary artery bypass grafting; CAD = coronary artery disease; LAD = left anterior descending coronary artery; PCI = percutaneous coronary intervention; SYNTAX = Synergy between Percutaneous Coronary Intervention with TAXUS and Cardiac Surgery.

^aClass of recommendation.

^bLevel of evidence.

^cPCI should be considered if the Heart Team is concerned about the surgical risk or if the patient refuses CABG after adequate counselling by the Heart Team.

^dFor example, absence of previous cardiac surgery, severe morbidities, frailty, or immobility precluding CABG (also see Table 5).

La CRM es un tratamiento convencional para pacientes (p) con lesión de TCI.

La ATC con stents liberadores de droga (DES) es en una opción factible, con bajas tasas de reestenosis, y con mortalidad similar a la cirugía.

Anatomically and clinically based recommendations for revascularization in CCS	Class^a	Level^b
Left main disease		
In CCS patients at low surgical risk ^c with significant left main coronary stenosis, CABG:		
• is recommended over medical therapy alone to improve survival; ⁷¹⁹	I	A
• is recommended as the overall preferred revascularization mode over PCI, given the lower risk of spontaneous myocardial infarction and repeat revascularization. ^{728,730,782}	I	A
In CCS patients with significant left main coronary stenosis of low complexity (SYNTAX score ≤22), in whom PCI can provide equivalent completeness of revascularization to that of CABG, PCI is recommended as an alternative to CABG, given its lower invasiveness and non-inferior survival. ^{718,728,730,802,813}	I	A
In CCS patients with significant left main coronary stenosis of intermediate complexity (SYNTAX score 23–32), in whom PCI can provide equivalent completeness of revascularization to that of CABG, PCI should be considered, given its lower invasiveness and non-inferior survival. ^{718,728,730,802,805,809,813,820,822}	IIa	A
Left main with multivessel disease^d		
In CCS patients at low surgical risk with suitable anatomy, CABG is recommended over medical therapy alone to improve survival. ^{718,719,870}	I	A
In CCS patients at high surgical risk, PCI may be considered over medical therapy alone. ^{728,813}	IIb	B

TABLE 3 Recent Changes of PCI Recommendation Guidelines for LMCA Disease

Guidelines	Class of Recommendation	Level of Evidence
Pre-EXCEL and NOBLE		
2014 ESC/EACTS ⁵⁵	I: LMCA disease with a SYNTAX score of ≤ 22 IIa: LMCA disease with a SYNTAX score of 23–32 III: LMCA disease with a SYNTAX score of ≥ 33	B
2014 ACC/AHA ⁵⁷	IIa: For SIHD patients when both of the following are present: <ul style="list-style-type: none"> Anatomic conditions associated with a low risk of PCI procedural complications and a high likelihood of good long-term outcomes (eg, a low SYNTAX score of ≤ 22, ostial or trunk LMCA stenosis) Clinical characteristics that predict a significantly increased risk of adverse surgical outcomes (eg, STS-predicted risk of operative mortality of $>5\%$) IIb: For SIHD patients when both of the following are present: <ul style="list-style-type: none"> Anatomic conditions associated with a low-to intermediate risk of PCI procedural complications and an intermediate to high likelihood of good long-term outcome (eg, low-intermediate SYNTAX score of <33, distal bifurcation LMCA stenosis) Clinical characteristics that predict an increased risk of adverse surgical outcomes (eg, moderate-severe chronic obstructive pulmonary disease, disability from previous stroke, or previous cardiac surgery; STS-predicted risk of operative mortality of $>2\%$) III: For SIHD patients (vs performing CABG) with unfavorable anatomy for PCI and who are good candidates for CABG	B B B
Post-EXCEL and NOBLE		
2018 ESC/EACTS ⁵⁶	I: LMCA disease with a SYNTAX score of ≤ 22 IIa: LMCA disease with a SYNTAX score of 23–32 III: LMCA disease with a SYNTAX score of ≥ 33	A
2021 ACC/AHA ⁵⁸	IIa: In selected patients with SIHD and significant LMCA disease for whom PCI can provide equivalent revascularization to that possible with CABG, PCI is reasonable to improve survival.	B
ACC = American College of Cardiology; AHA = American Heart Association; EACTS = European Association for Cardio-Thoracic Surgery; ESC = European Society of Cardiology; SIHD = stable ischemic heart disease; STS = Society of Thoracic Surgeons; other abbreviations as in Tables 1 and 2 .		

PCI

FAVOURS PCI

Clinical characteristics

Presence of severe co-morbidity (not adequately reflected by scores)

Advanced age/frailty/reduced life expectancy

Restricted mobility and conditions that affect the rehabilitation process

Anatomical and technical aspects

MVD with SYNTAX score 0-22

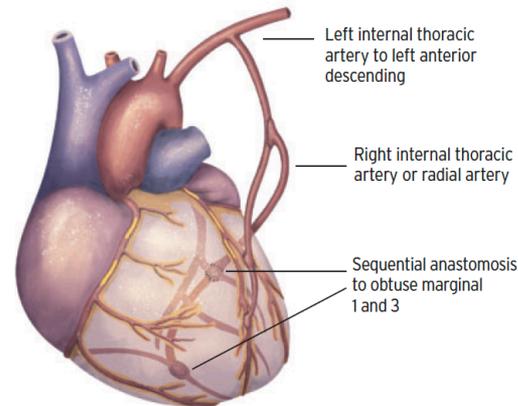

Anatomy likely resulting in incomplete revascularization with CABG due to poor quality or missing conduits

Severe chest deformation or scoliosis

Sequelae of chest radiation

Porcelain aorta^a

CABG

FAVOURS CABG

Clinical characteristics

Diabetes

Reduced LV function (EF \leq 35%)

Contraindication to DAPT

Recurrent diffuse in-stent restenosis

Anatomical and technical aspects

MVD with SYNTAX score \geq 23

Anatomy likely resulting in incomplete revascularization with PCI

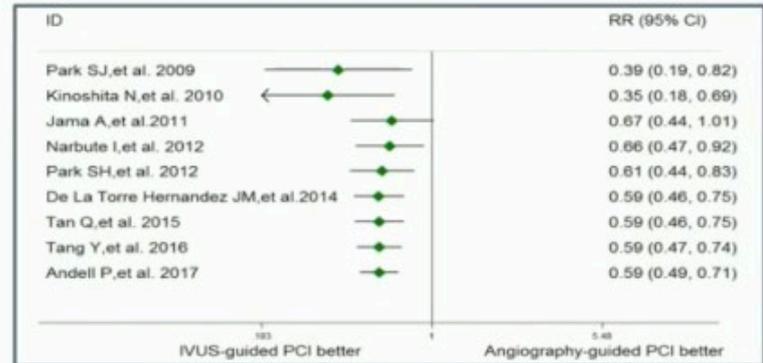

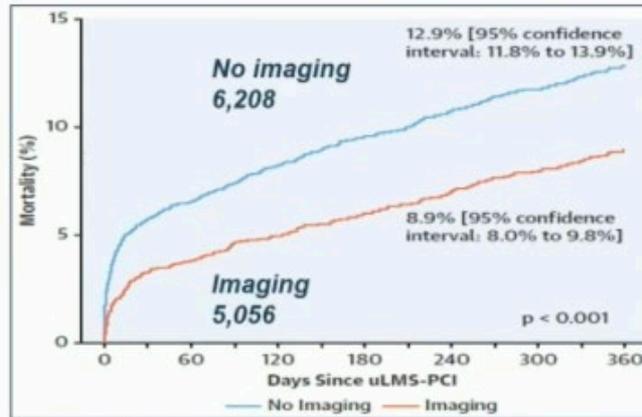

Severely calcified coronary artery lesions limiting lesion expansion

Need for concomitant interventions

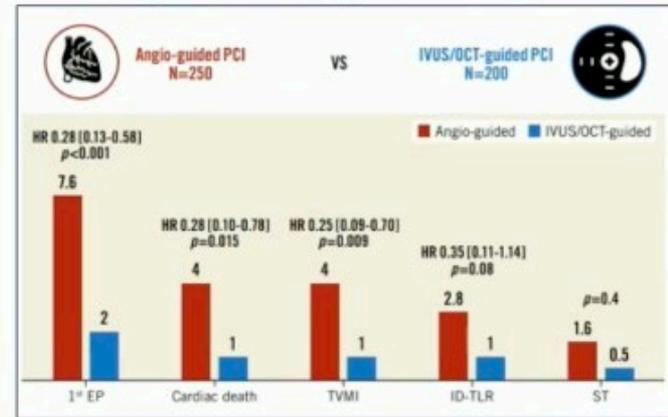

Ascending aortic pathology with indication for surgery

Concomitant cardiac surgery

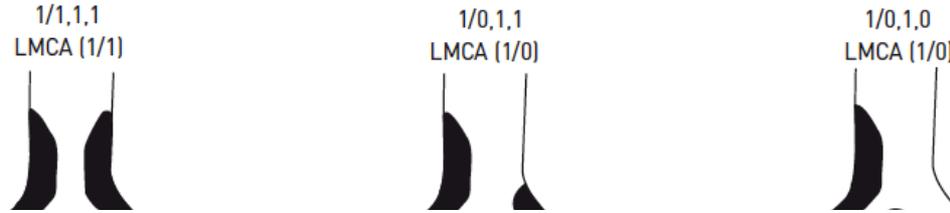

Registries show consistent benefits for IVUS guided LM PCI

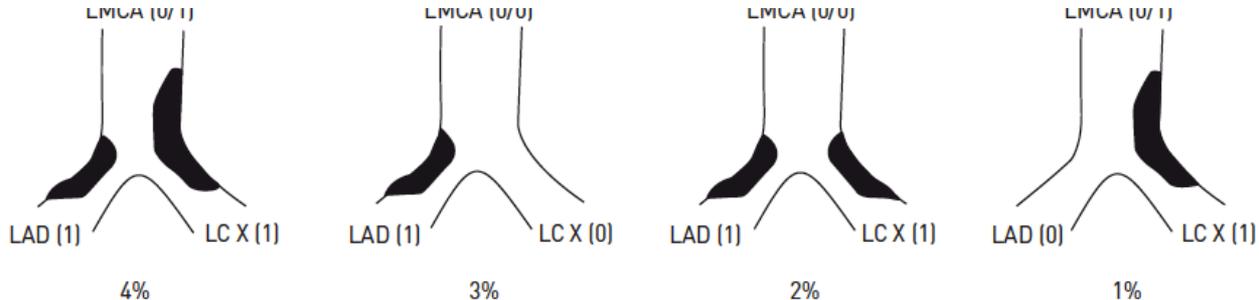

Ye Y, et al. PLoS ONE 12(6): e0179756.

Anatomy and pathophysiology

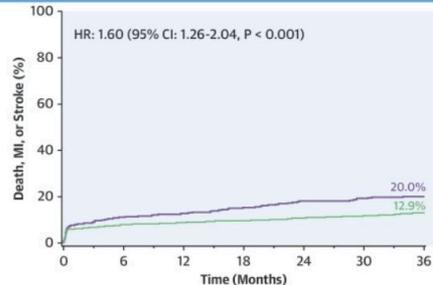

Continuous involvement from the distal LMS into the proximal LAD is present in 90% of cases.

Impacto de Diabetes Mellitus a 3 años de revascularización de TCI

Recommendations for Patients With Diabetes

Referenced studies that support the recommendations are summarized in [Online Data Supplement 14](#).

COR	LOE	RECOMMENDATIONS
1	A	1. In patients with diabetes and multivessel CAD with the involvement of the LAD, who are appropriate candidates for CABG, CABG (with a LIMA to the LAD) is recommended in preference to PCI to reduce mortality and repeat revascularizations (1-8).
2a	B-NR	2. In patients with diabetes who have multivessel CAD amenable to PCI and an indication for revascularization and are poor candidates for surgery, PCI can be useful to reduce long-term ischemic outcomes (9,10).
2b	B-R	3. In patients with diabetes who have left main stenosis and low- or intermediate-complexity CAD in the rest of the coronary anatomy, PCI may be considered an alternative to CABG to reduce major adverse cardiovascular outcomes (5,11).

Intracoronary Stenting Without Anticoagulation Accomplished With Intravascular Ultrasound Guidance

Antonio Colombo, MD; Patrick Hall, MD; Shigeru Nakamura, MD; Yaron Almagor, MD; Luigi Maiello, MD; Giovanni Martini, CCP; Antonio Gaglione, MD; Steven L. Goldberg, MD; Jonathan M. Tobis, MD

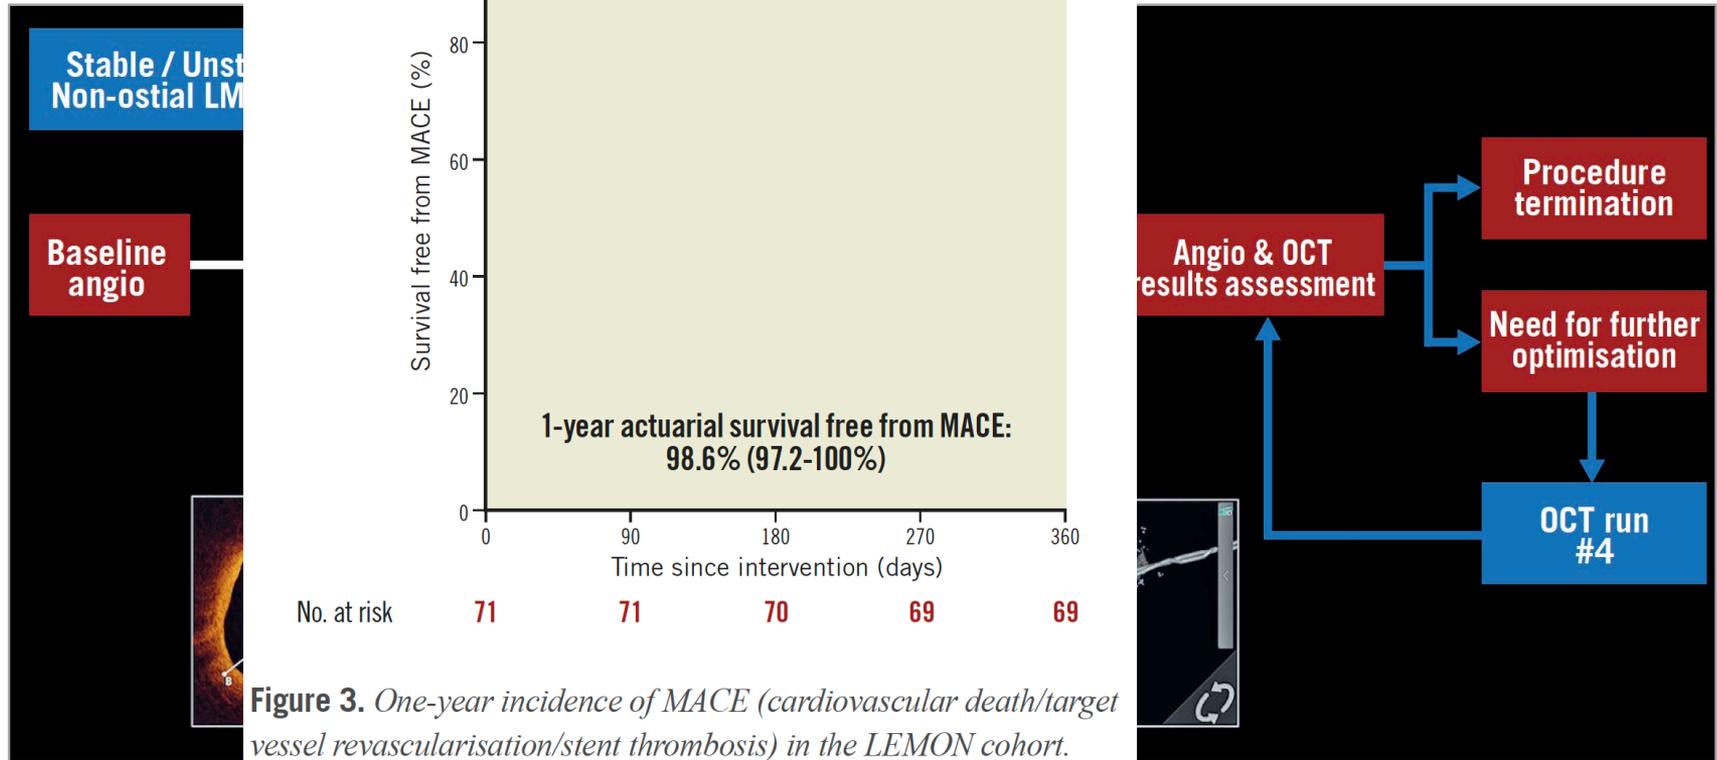

Despite this aggressive inflation approach, 40% of the stents with an acceptable angiographic result still required additional dilatation with higher pressures or, less commonly, a dilatation with a larger balloon

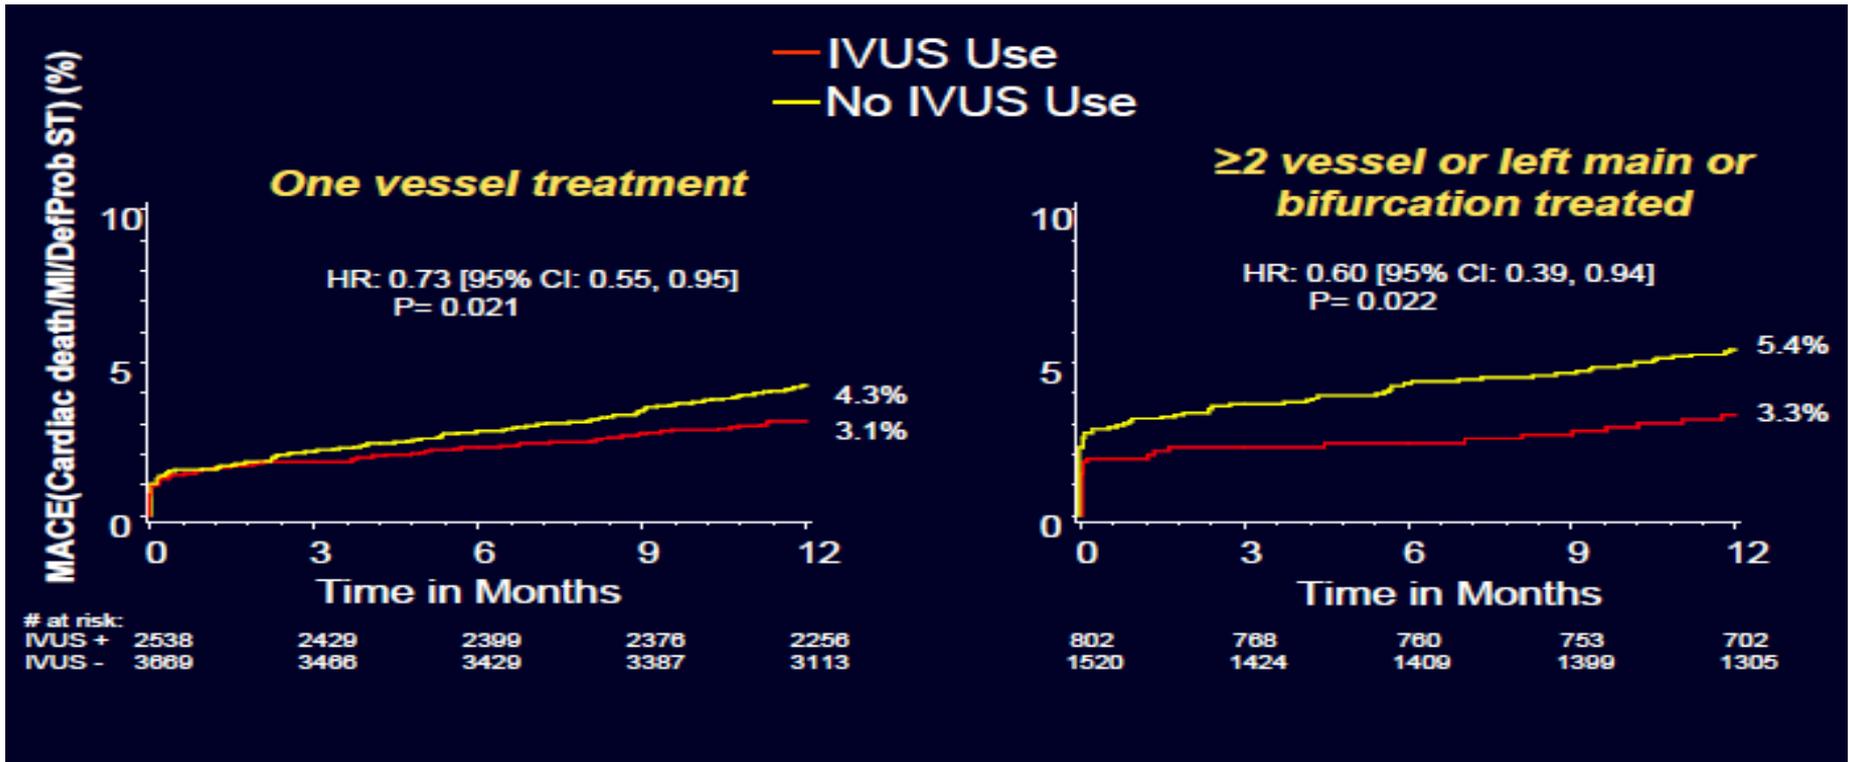

IVUS in LM PCI: tips.

- JL4 guiding catheter*
- Coaxial positioning of the guide catheter tip is essential to allow appropriate visualization of all LM layers.
- Decannulation of the guide catheter from the LMS is usually required.
- In cases of tight lesions can cause severe ischemia/hemodynamic instability.
- Ensure the image depth is increased to the maximum.
- For LMS bifurcation analyses:
Wire both LAD and LCx. This will potentially allow for the appropriate visualization of the carina/ostia (by reducing the bifurcation angle) as it would appear after implantation with a metallic stent.

CENTRAL ILLUSTRATION Left Main Coronary Artery Disease Clinical Decision-Making Algorithm

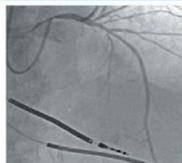

Davidson LJ, et al. *J Am Coll Cardiol.* 2022;80(22):2119-2134.

This algorithm outlines a clinical approach that may be utilized by clinicians to assist with decision-making for patients who present with left main coronary artery disease. Medical therapy, percutaneous coronary intervention (PCI), or coronary artery bypass grafting (CABG) may be reasonable strategies depending on each patient's clinical history, anatomy, and preferences.

Left Main PCI and Lesion Anatomy, Morphology, and Complexity: Technical Considerations for PCI in Left Main Disease

Ostial or mid-shaft (nonbifurcation)

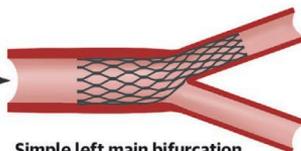

Ostial or mid-shaft (nonbifurcation):
Single-stent strategy with IVUS
guidance and optimization

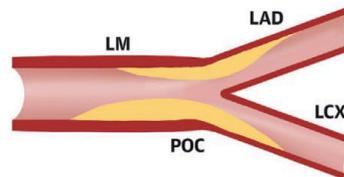

Distal left main bifurcation (eg Medina 1,1,1 or O,1,1)

Simple left main bifurcation
(and low-risk of side branch compromise):
Provisional single-stent strategy with IVUS
guidance or optimization

Complex left main bifurcation
(and high-risk of side branch compromise):
Up-front 2-stent strategy (eg, DK-Crush, Culotte,
T-and-Protrusion) with IVUS guidance and optimization
to include KBI and POT

Left main coronary artery lesion angiography
and intravascular imaging characteristics include:

- Lesion length
- Lesion diameter
- Lesion location (eg, shaft vs bifurcation)
- Bifurcation vessel (eg, LAD and/or LCX) involvement
- Bifurcation angle
- Plaque burden and morphology (eg, calcification)
