Background and Rationale

- Large-scale randomized trials have established the efficacy of several interventions for the management of patients with ACS
- Registries have consistently demonstrated that the translation of research findings into practice is suboptimal and that these care gaps are even greater in low- and middle-income countries
- QI interventions have rarely been rigorously evaluated, especially in low- and middle-income countries, where up to 80% of the global burden of cardiovascular diseases resides

THE BRIDGE-ACS TRIAL

- **Design:** Pragmatic Cluster Randomized Trial
- **Prevention of Bias:**
 - Concealed allocation (central web-based randomization) and Intention-to-treat analysis
 - Blinding of outcome assessors
- **Quality control:** on-site monitoring + central statistical checking + e-CRF + central adjudication of eligibility criteria and endpoints
- **Sample Size:** 1,150* patients from 34 clusters(public hospitals) in Brazil recruited between March and November 2011

* Original Target Sample Size: 1020

34 Clusters(Public General Hospitals) including 1,150 consecutive patients with ACS

Inclusion criteria: consecutive patients with ACS (STEMI, NSTEMI, and UA) as soon as they presented in Emergency Department.

Exclusion criteria: patients who were transferred from other hospitals within >12 hours, patients with non-type I myocardial infarction, and patients for whom the presumptive admission diagnosis of ACS was not confirmed.

Concealed Randomization

Multifaceted Quality Improvement Intervention
(n= 17 clusters and 602 patients)

ITT

Routine Practice
(n= 17 clusters and 548 patients)

ITT

Primary Endpoint: Adherence to all eligible evidence-based therapies during the first 24 hours

Secondary Endpoints: Adherence to all eligible evidence-based therapies during the first 24 hours and at discharge, composite EBM score, major cardiovascular events

Multifaceted Quality Improvement Intervention

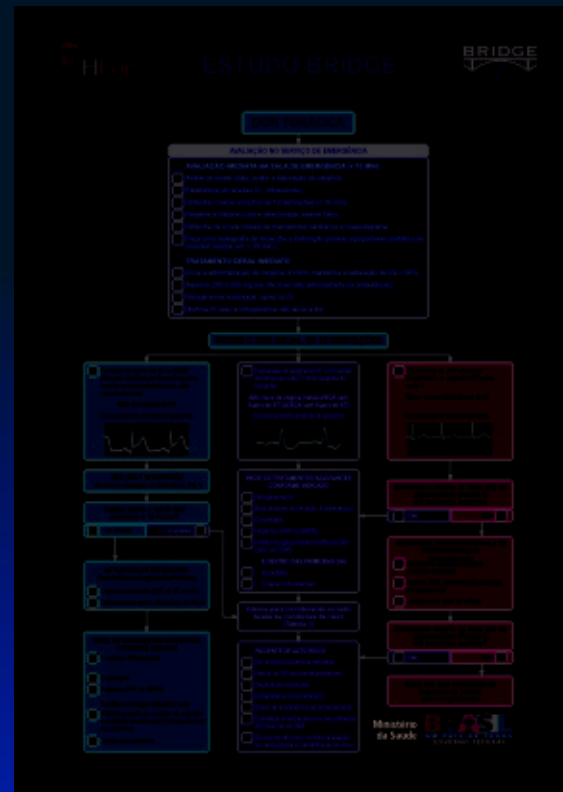

"Chest Pain" Label

Checklist

The multifaceted quality improvement intervention included reminders, a checklist, case management, and educational materials (pocket guidelines, posters and a interactive website).

A checklist titled 'ESTUDO BRIDGE' for chest pain management. It includes a header with the title and a list of items to be checked. The items are organized into sections: 'PACIENTES EM SITUAÇÃO DE EMERGÊNCIA' and 'PACIENTES EM SITUAÇÃO DE NÃO EMERGÊNCIA'. The checklist is color-coded with blue and red boxes.

Multifaceted Quality Improvement Intervention

"Chest Pain" Label

Checklist

Colored Bracelet (according to the risk stratification)

The multifaceted quality improvement intervention included reminders, a checklist, case management, and educational materials (pocket guidelines, posters and a interactive website).

Multifaceted Quality Improvement Intervention

The multifaceted quality improvement intervention included reminders, a checklist, case management, and educational materials (pocket guidelines, posters and a interactive website).

ESTUDO BRIDGE

TERAPIA MEDICAMENTOSA	
ASPIRINA	Dose padrão recomendada: 160 a 325mg
TERAPIAS DE REPERFUSÃO	Na ausência de contra-indicações, agentes fibrinolíticos para reperfusão nos pacientes com SCA com Supra de ST com início dos sintomas < 12h
Nitroglicerina ou Nitrito	Indicada para desconforto torácico agudo, manuseio da hipertensão arterial, congestão pulmonar. Dose: até 3 doses de nitrito em intervalos de 3 a 5 min até o alívio da dor; contra-indicação: PAS > 200mmHg; TC > 100 e > 100 bpm na ausência de IC, infarto VD, Síncope ou síncope (24 a 48h)
MORFINA	Dor contínua que não responde aos nitratos; contra-indicação: PAS > 90 mm Hg; Infarto VD; Hese dose de 2 a 4mg IV em intervalos de 5 a 15 min.

TERAPIA MEDICAMENTOSA COADJUVANTE					
CLORIDREL	B-Blockers	HEPARINA NÃO FRAÇONADA (PNF)	HEPARINA DE BAIXO PESO MOLECULAR (BPM)	INIBIDORES DA GLUCOPROTEÍNA	ICA
<p>• Pacientes < 75 anos com SCA com de ST com indicação de fibrinólise</p> <p>Dose: 150mg de dose de ataque</p> <p>Manutenção: 150mg</p>	<p>Dose inicial: 20mg IV</p> <p>Intervalo: 20mg IV</p> <p>Manutenção: 20mg IV</p> <p>Condição: 12mg IV</p>	<p>• Pacientes < 75 anos com SCA com Supra de ST com indicação de fibrinólise</p> <p>Dose: 60U/kg em bolo seguido de infusão contínua de 12 U/kg por hora</p>	<p>• Pacientes < 75 anos com SCA com Supra de ST com indicação de fibrinólise</p> <p>Dose: 0,5mg/kg IV</p> <p>Intervalo: 0,5mg/kg IV</p> <p>Condição: 0,5mg/kg IV</p>	<p>• Pacientes < 75 anos com SCA com Supra de ST com indicação de fibrinólise</p> <p>Dose: 30mg IV</p> <p>Intervalo: 30mg IV</p> <p>Condição: 30mg IV</p>	<p>• Pacientes < 75 anos com SCA com Supra de ST com indicação de fibrinólise</p> <p>Dose: 10mg IV</p> <p>Intervalo: 10mg IV</p> <p>Condição: 10mg IV</p>

Pocket Guidelines

Estudo Bridge HCor

Terapias que salvam vidas na principal causa de óbitos no mundo!

Você pode fazer a diferença no tratamento da Síndrome Coronariana Aguda

- Reperfusion com fibrinolíticos: 131 vidas salvas para 1000 pacientes tratados quando fibrinolíticos foram administrados nas primeiras 3 horas
- AAS na admissão do paciente com IAM reduz o risco de óbito em 23%. AAS prescrito na alta, como prevenção secundária, diminui o risco de óbito em 15%
- Trombolíticos para SCA com Supra de ST reduz o risco de óbito em 18%
- Inibidores da Enzima Conversora da Angiotensina para IAM reduzem o risco de óbito em 6,5% nas primeiras 24h.
- Estatina prescrita na alta como prevenção secundária reduz o risco de óbito em 6,5%
- Beta-bloqueador prescrito na alta como prevenção secundária reduz o risco de óbito em 21%

Educational material

Endpoints

■ Primary endpoint

- Adherence to all evidence-based therapies (aspirin, clopidogrel; anticoagulation therapy and statins) during the first 24 hours in patients without contraindications

■ Secondary endpoints

- Adherence to all evidence-based therapies at admission and within one week of discharge (aspirin, clopidogrel, anticoagulation and statins during the first 24 hours and aspirin, beta-blockers, statins, and angiotensin-converting enzyme inhibitors at discharge)
- Composite adherence score (CRUSADE endpoint)
- Major cardiovascular events (CV mortality, non-fatal MI, Non-fatal stroke and non-fatal cardiac arrest)
- All-cause mortality
- Major bleeding

Statistical Analysis

- All analyses followed the intention-to-treat principle
- Comparisons between intervention and control groups were conducted using a generalized estimation equation (GEE) extension of logistic regression procedures for cluster-randomized trials
- Effects were expressed as a population average odds ratio (OR_{PA}) and 95% CIs
- Analyses were performed by the HCOR Research Institute (São Paulo, Brazil) and validated by the Duke Clinical Research Institute (Durham, NC)

Patient Baseline Characteristics

Patient Baseline Characteristics	Intervention (n=602)	Control (n=548)
Male, no. (%)	413 (68.6)	376 (68.6)
Age, mean \pm SD, yrs	62 \pm 13	62 \pm 13
Diabetes, no. (%)	175 (29.1)	182 (33.2)
Hypertension, no. (%)	433 (71.9)	402 (73.4)
Dyslipidemia, no. (%)	216 (35.9)	162 (29.6)
Current smoker, no. (%)	187 (31.1)	147 (26.8)
Family history of coronary artery disease, no. (%)	242 (40.2)	242 (44.2)
Angina, no. (%)	243 (40.4)	177 (32.3)
Renal failure, no. (%)	31 (5.1)	24 (4.4)
Previous myocardial infarction, no. (%)	146 (24.3)	121 (22.1)
Previous percutaneous coronary intervention, no. (%)	91 (15.1)	88 (16.1)
Cerebrovascular disease, no. (%)	53 (8.8)	48 (8.8)
Previous coronary artery bypass graft, no. (%)	57 (9.5)	34 (6.2)
Use of aspirin in the last month, no. (%)	197 (32.7)	178 (32.5)
Final diagnosis, no. (%)		
ST-elevation myocardial infarction	232 (38.5)	236 (43.1)
Non-ST-elevation myocardial infarction	230 (38.2)	180 (32.8)
Unstable angina	140 (23.3)	132 (24.1)

Cluster Baseline Characteristics

Cluster Baseline Characteristics	Intervention (n=17)	Control (n=17)
Cardiologist available at ED ¹ , no. (%)	12 (70.6)	12 (70.6)
Cardiac surgery team available 24 hours, no. (%)	6 (35.3)	7 (41.2)
Percutaneous coronary intervention capabilities, no. (%)	7 (41.2)	7 (41.2)
Coronary care unit, no. (%)	10 (58.8)	9 (52.9)
Teaching hospital, no. (%)	14 (82.4)	13 (76.5)
Chest pain protocol at ED ¹ , no. (%)	13 (76.5)	11 (64.7)
Prior participation on multicenter clinical trial, no. (%)	8 (47.1)	7 (41.2)
Volume of patients seen in the ED ¹ per month, median (25th, 75th)	4537 (2698, 13485)	4175 (1000, 10500)
Number of beds (coronary care unit), median (25th, 75th)	8 (7, 10)	9 (7, 10)

Results

■ Intervention ■ Control

$OR_{PA} = 2.64 (1.28-5.45)$

$OR_{PA} = 2.63 (1.27-5.42)$

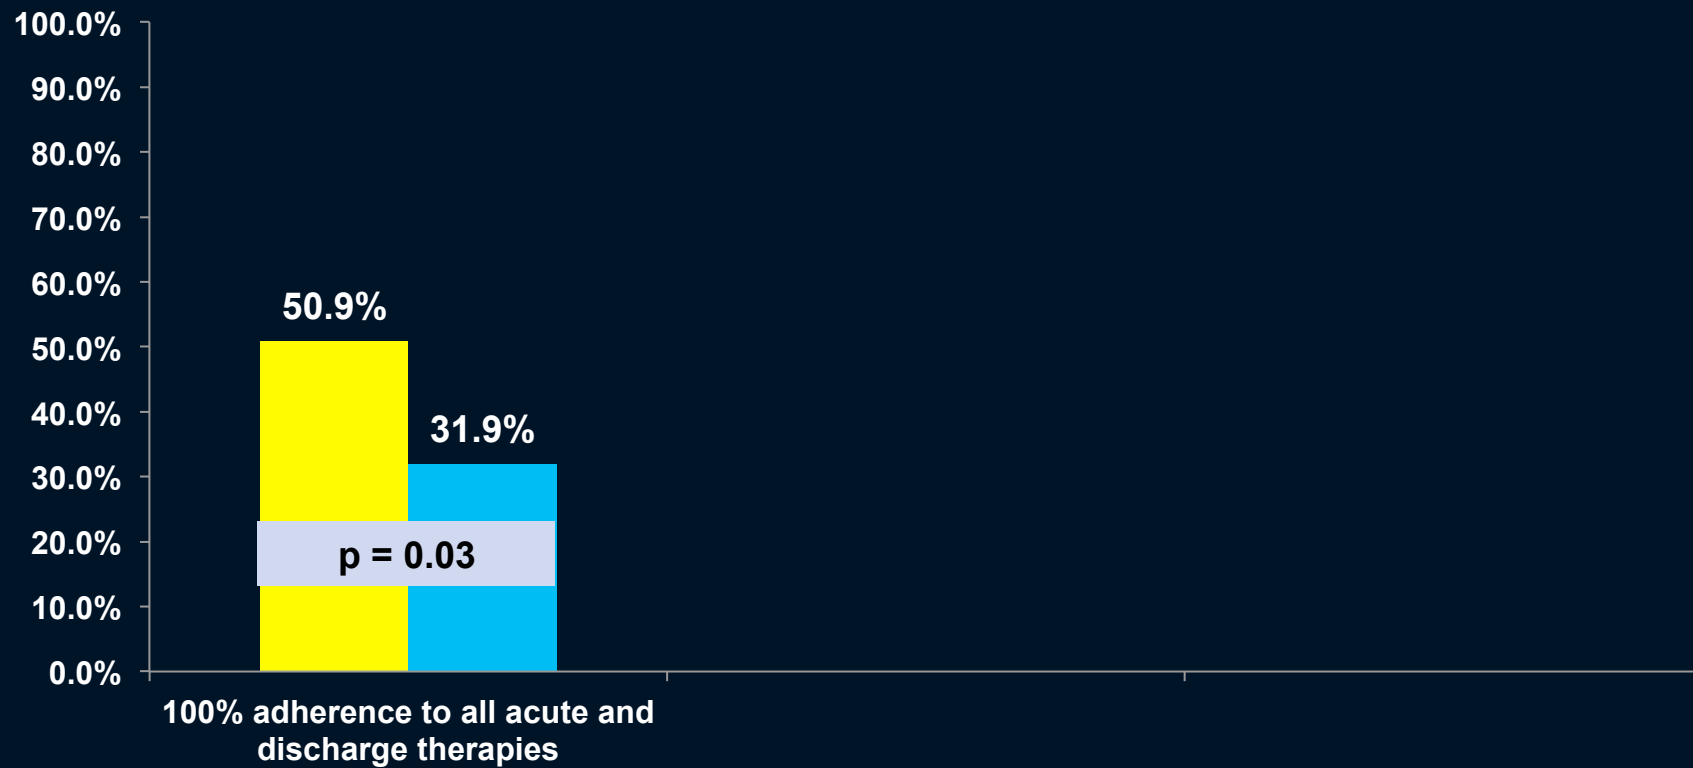

Results

■ Intervention ■ Control

$OR_{PA} = 2.49 (1.08-5.74)$

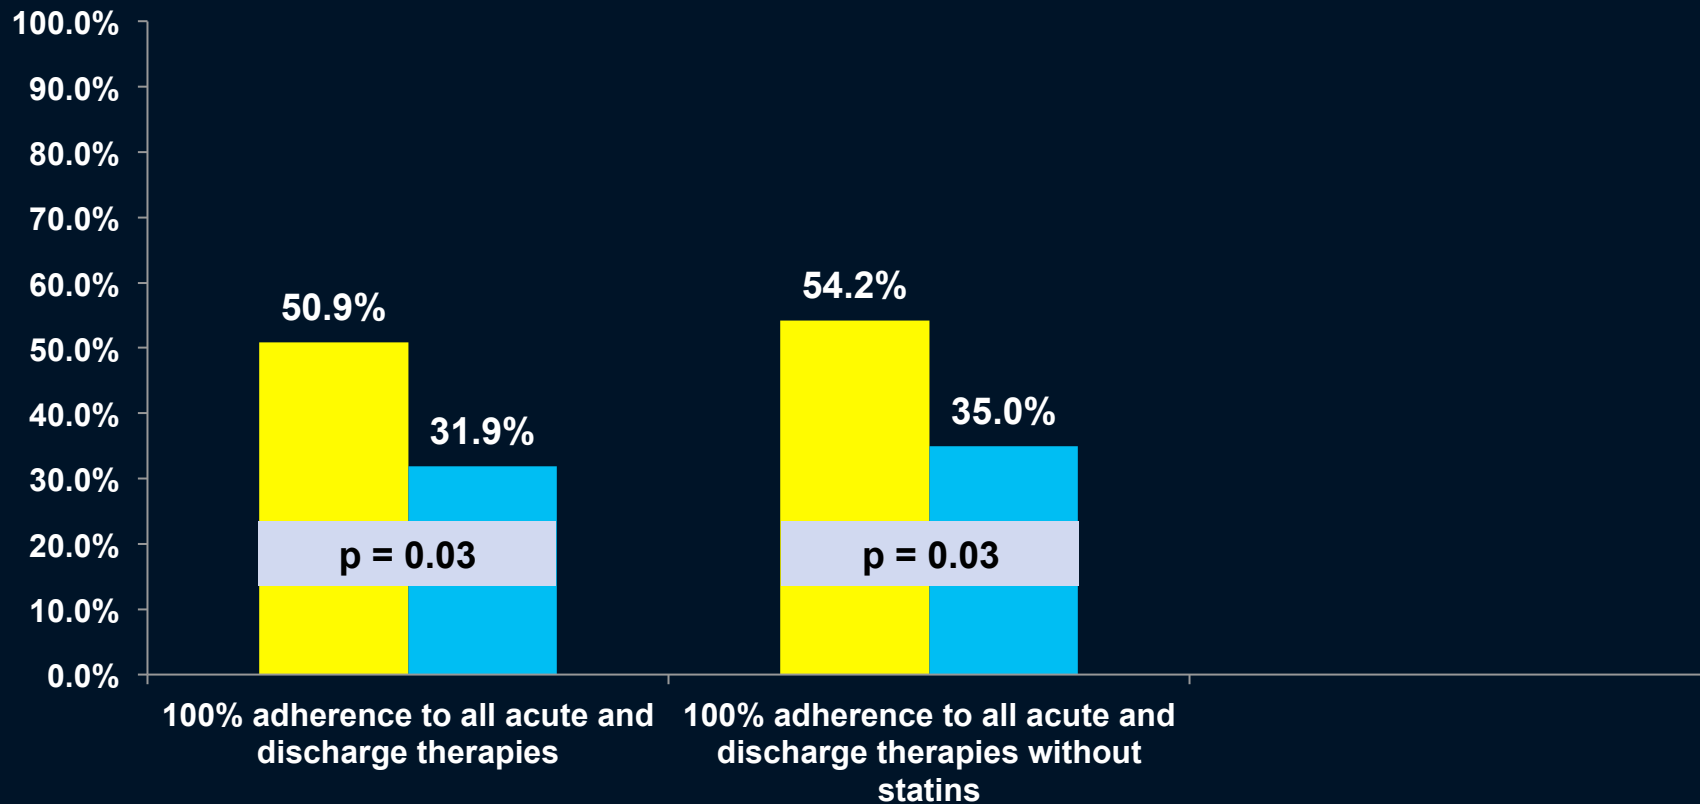

Results

■ Intervention ■ Control

$OR_{PA} = 2.49 (1.08-5.74)$

$OR_{PA} = 2.47 (1.08-5.68)$

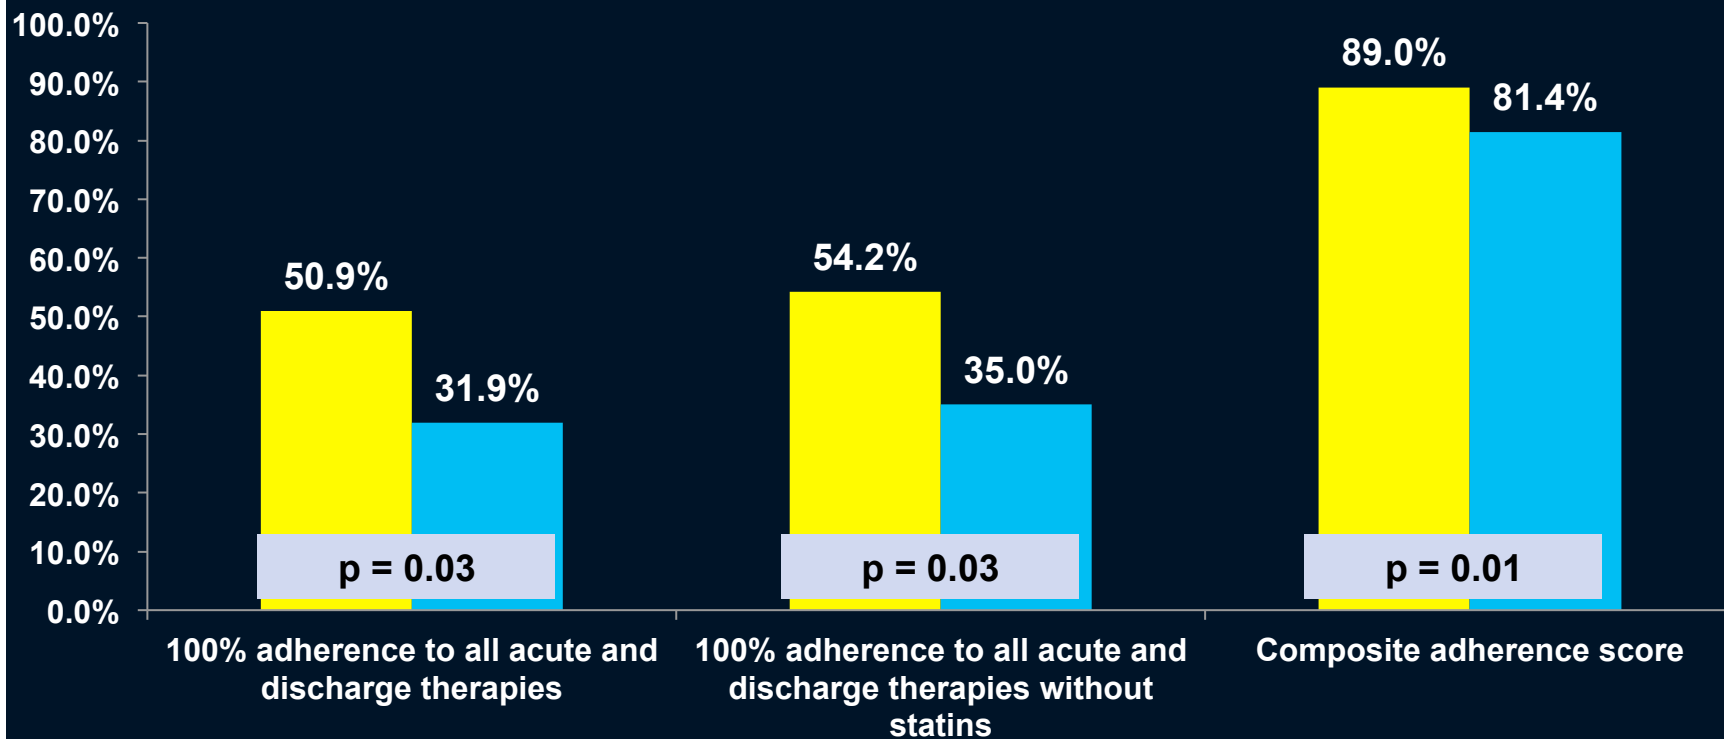

Results

■ Intervention ■ Control

$OR_{PA} = 2.49 (1.08-5.74)$

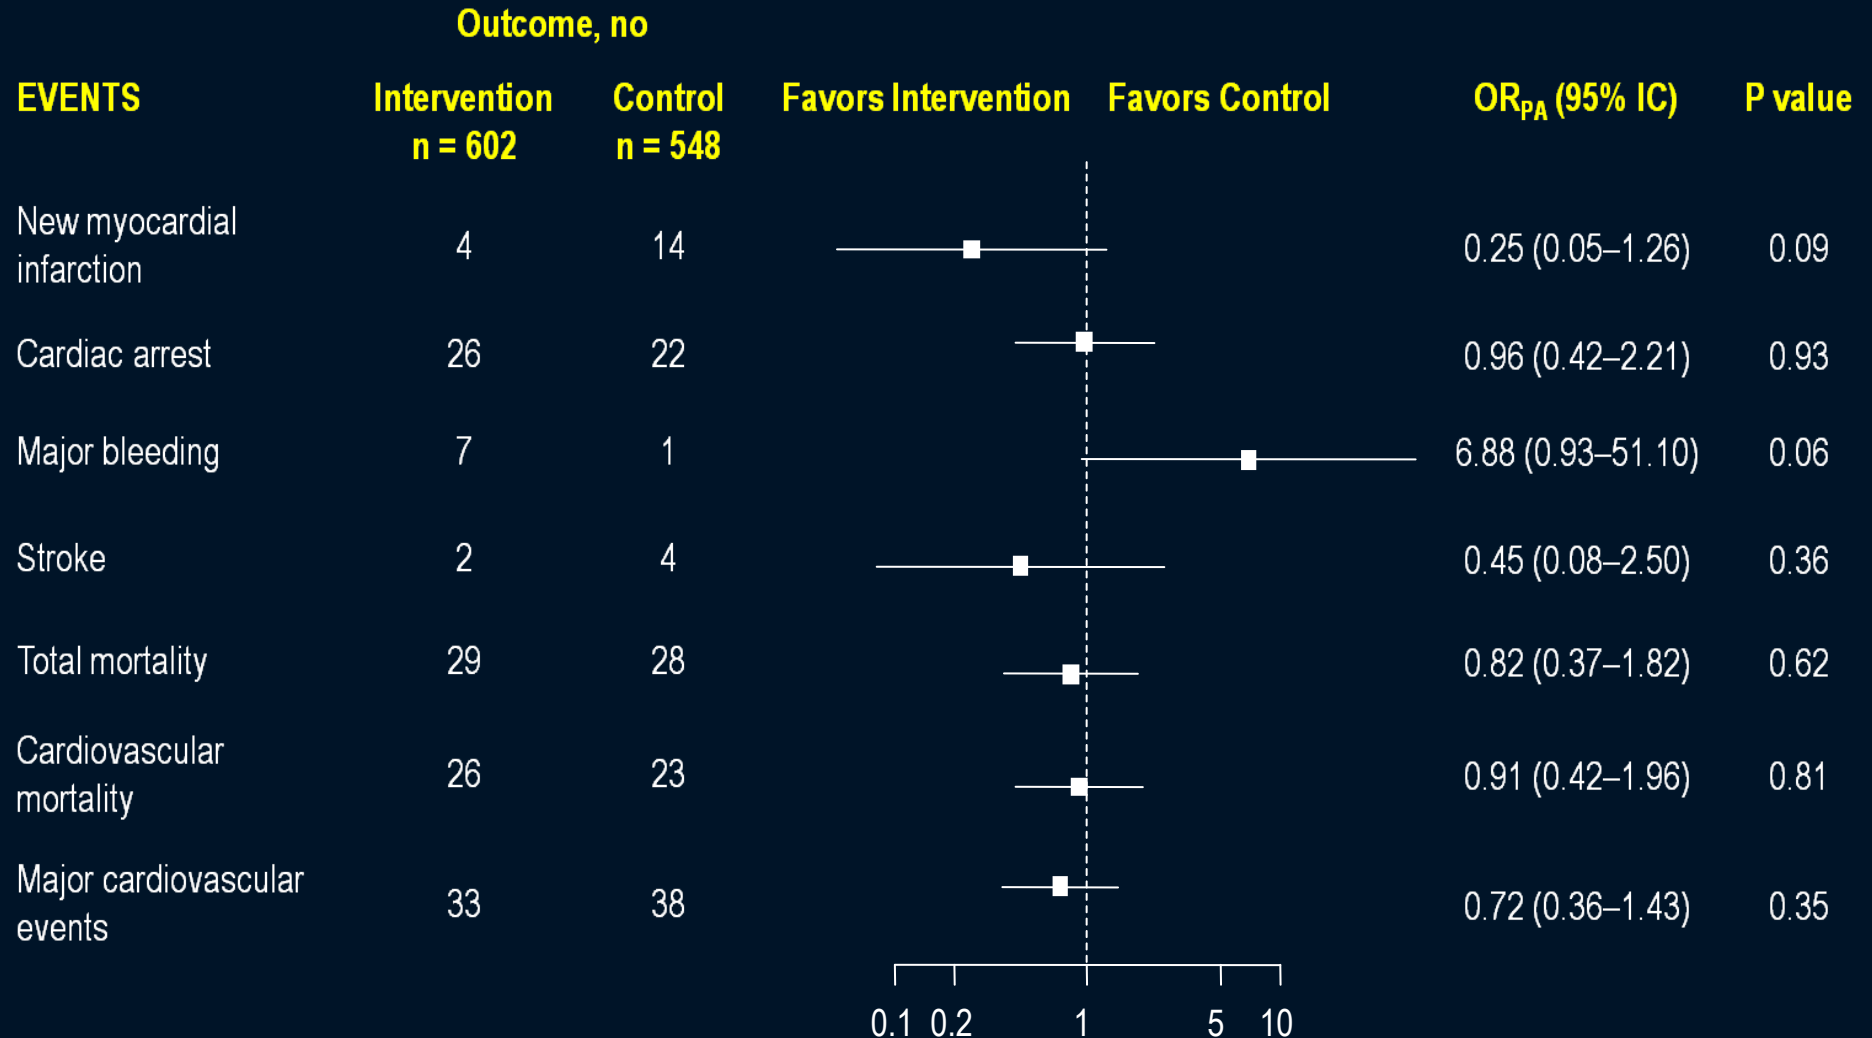

$OR_{PA} = 2.47 (1.08-5.68)$

Mean difference = 8.6 (2.2–15.0)

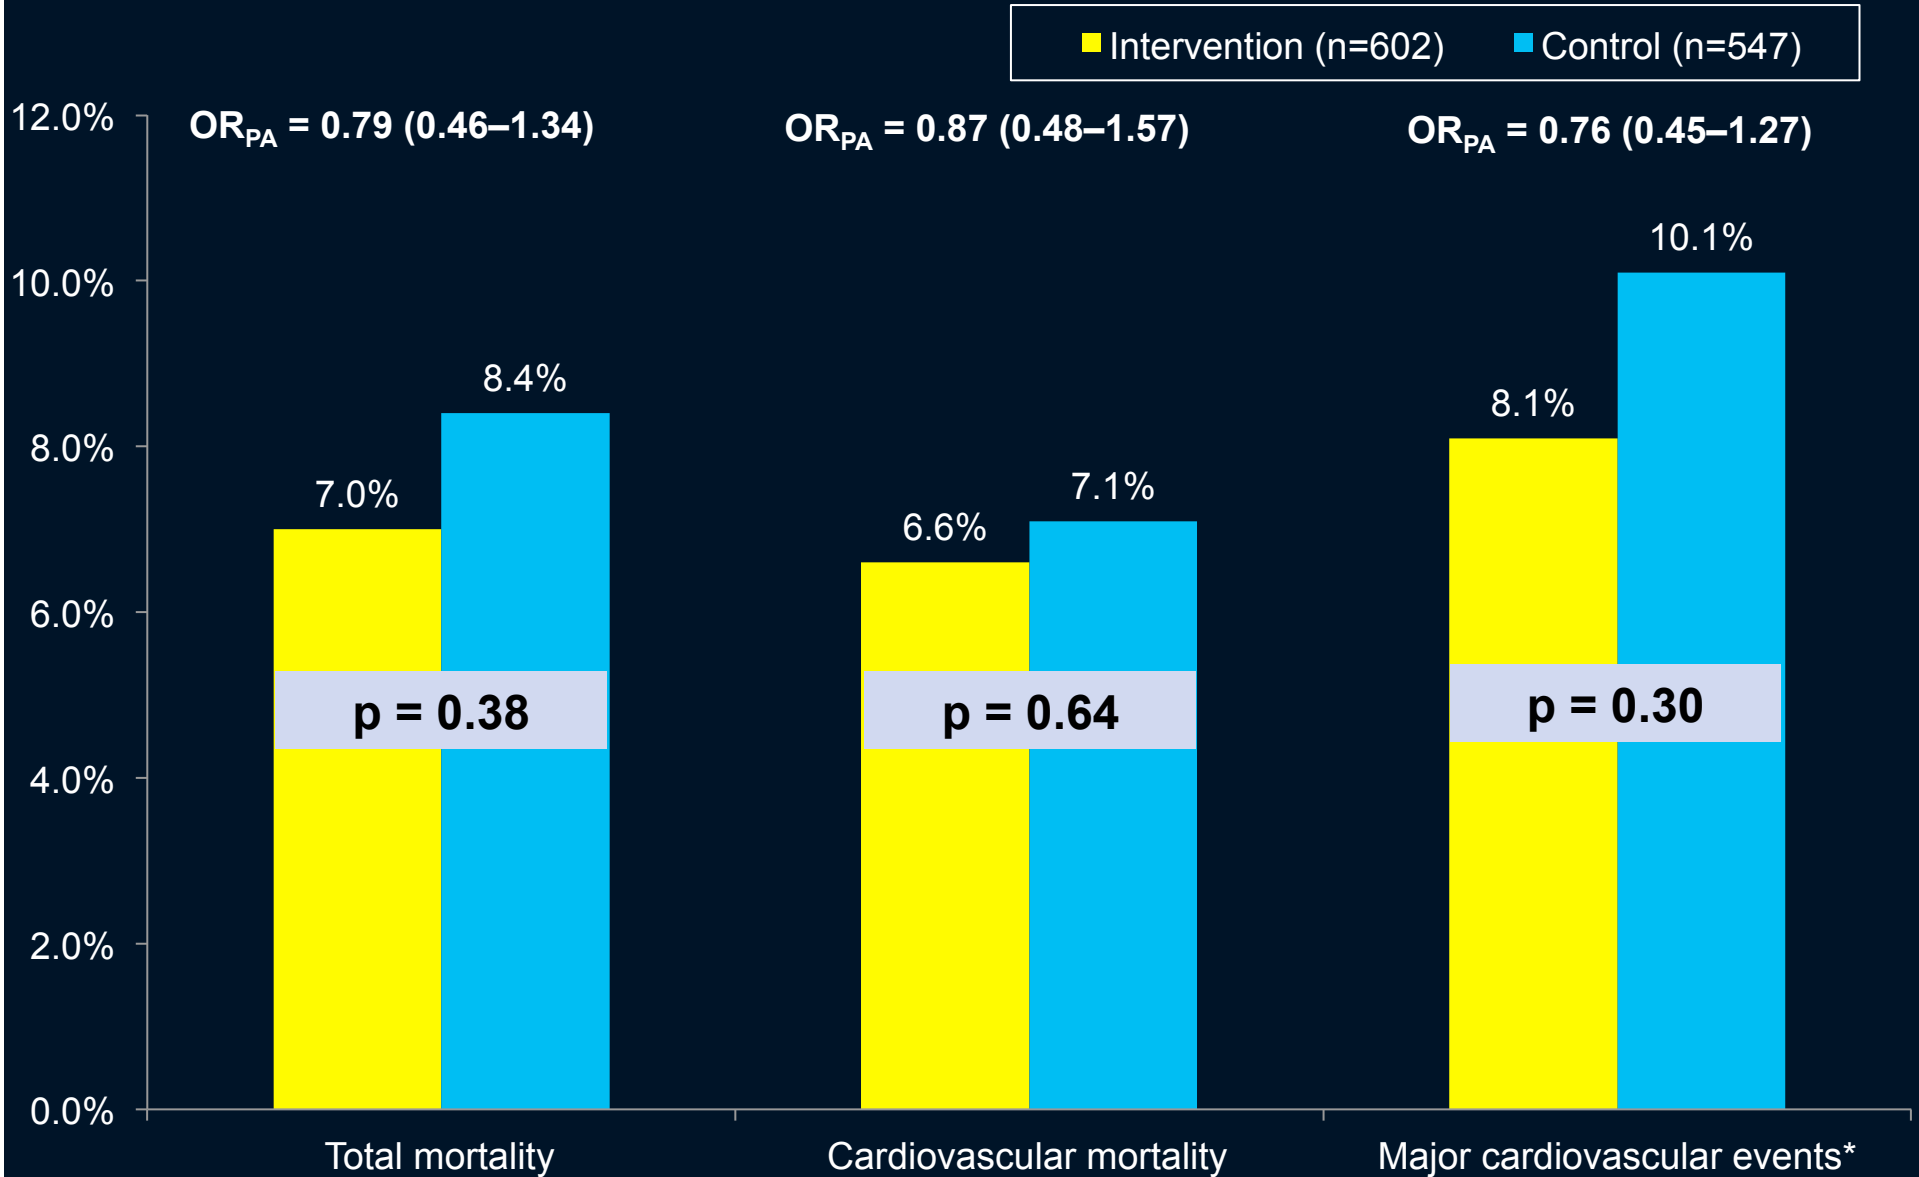

In-Hospital Clinical Outcomes

30-Day Clinical Outcomes

Conclusions

- In patients with ACS, a simple multifaceted educational intervention resulted in significant improvement in the use of evidence-based medications
- Because it is simple and feasible, the tools tested in the BRIDGE-ACS trial can become the basis for developing QI programs to maximize the use of evidence-based interventions for the management of ACS
