# Following the Guidelines

## Aortic Stenosis: Choice of Surgical or Transcatheter Intervention

Recommendations	COR	LOE
Surgical AVR is recommended in patients who meet an indication for AVR (listed in Section 3.4) with low or intermediate surgical risk	I	A
For patients in whom TAVR or high-risk surgical AVR is being considered, members of a Heart Valve Team should collaborate closely to provide optimal patient care	I	C
TAVR is recommended in patients who meet an indication for AVR for AS who have a prohibitive surgical risk and a predicted post-TAVR survival >12 months	I	B

*Helping Cardiovascular Professionals  
Learn. Advance. Heal.*

## Aortic Stenosis: Choice of Surgical or Transcatheter Intervention (cont.)

Recommendations	COR	LOE
TAVR is a reasonable alternative to surgical AVR for AS in patients who meet an indication for AVR and who have high surgical risk	IIa	B
Percutaneous aortic balloon dilation may be considered as a bridge to surgical or transcatheter AVR in severely symptomatic patients with severe AS	IIb	C
TAVR is not recommended in patients in whom the existing comorbidities would preclude the expected benefit from correction of AS	III: No Benefit	B

Helping Cardiovascular Professionals  
Learn. Advance. Heal.

# The Heart Valve Team and Heart Valve Centers of Excellence

Recommendations	COR	LOE
Patients with severe VHD should be evaluated by a multidisciplinary Heart Valve Team when intervention is considered	I	C
Consultation with or referral to a Heart Valve Center of Excellence is reasonable when discussing treatment options for 1) asymptomatic patients with severe VHD, 2) patients who may benefit from valve repair versus valve replacement, or 3) patients with multiple comorbidities for whom valve intervention is considered	IIa	C

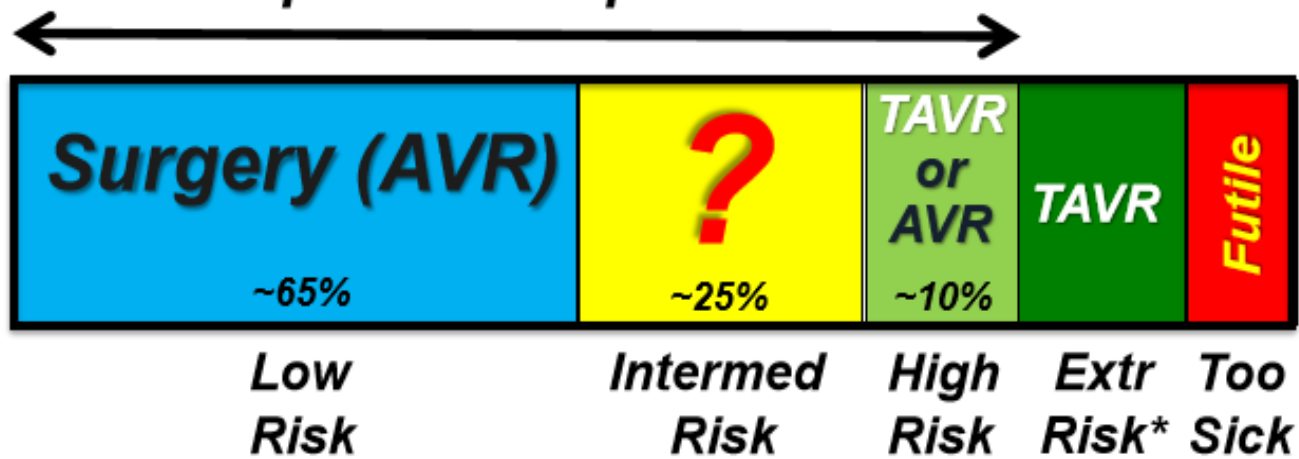

Helping Cardiovascular Professionals  
Learn. Advance. Heal.

# Role of the Heart Team Assessing Risk

Operable AS patients

***How do you define  
risk?***

# AVR Surgical Risk Algorithms

- Algorithms for estimating surgical risk generated from large patient databases
- Established risk algorithms
  - Society Thoracic Surgeons (STS): N=67,292 AVR
    - [riskcalc.sts.org/](http://riskcalc.sts.org/)
  - EuroSCORE (Additive, Log, EuroSCORE II): N=5595 Valve
    - <http://www.euroscore.org/calc.html>
  - Ambler Risk Score: N=32,839 Valve
    - <http://www.ucl.ac.uk/stats/research/riskmodel>
- In high-risk patients, STS most accurate, but tends to underestimate risk, while other models overestimate

## Risk Assessment Combining STS Risk Estimate, Frailty, Major Organ System Dysfunction, and Procedure-Specific Impediments

	Low Risk (must meet ALL criteria in this column )	Intermediate Risk (any 1 criteria in this column)	High Risk (any 1 criteria in this column)	Prohibitive Risk (any 1 criteria in this column)
STS PROM	<4% <b>AND</b>	4% to 8% <b>OR</b>	>8% <b>OR</b>	Predicted risk with surgery of death or major morbidity (all-cause) >50% at 1 y <b>OR</b>
Frailty	None <b>AND</b>	1 index (mild) <b>OR</b>	2 or more indices (moderate-to-severe) <b>OR</b>	
Major organ system compromise not to be improved postoperatively	None <b>AND</b>	1 organ system <b>OR</b>	No more than 2 organ systems <b>OR</b>	3 or more organ systems <b>OR</b>
Procedure-specific impediment	None	Possible procedure-specific impediment	Possible procedure-specific impediment	Severe procedure-specific impediment

Helping Cardiovascular Professionals  
Learn. Advance. Heal.

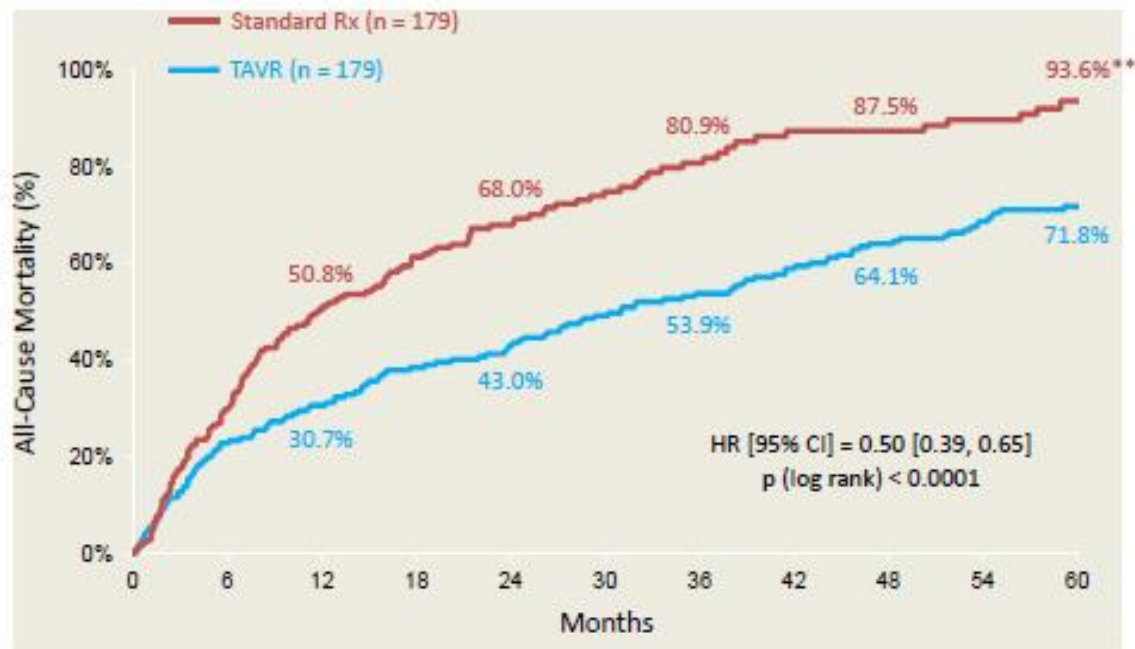

## Role of the Heart Team Assessing Risk

# TAVR Improves Survival

*PARTNER Cohort B (TAVR vs Standard Therapy)*

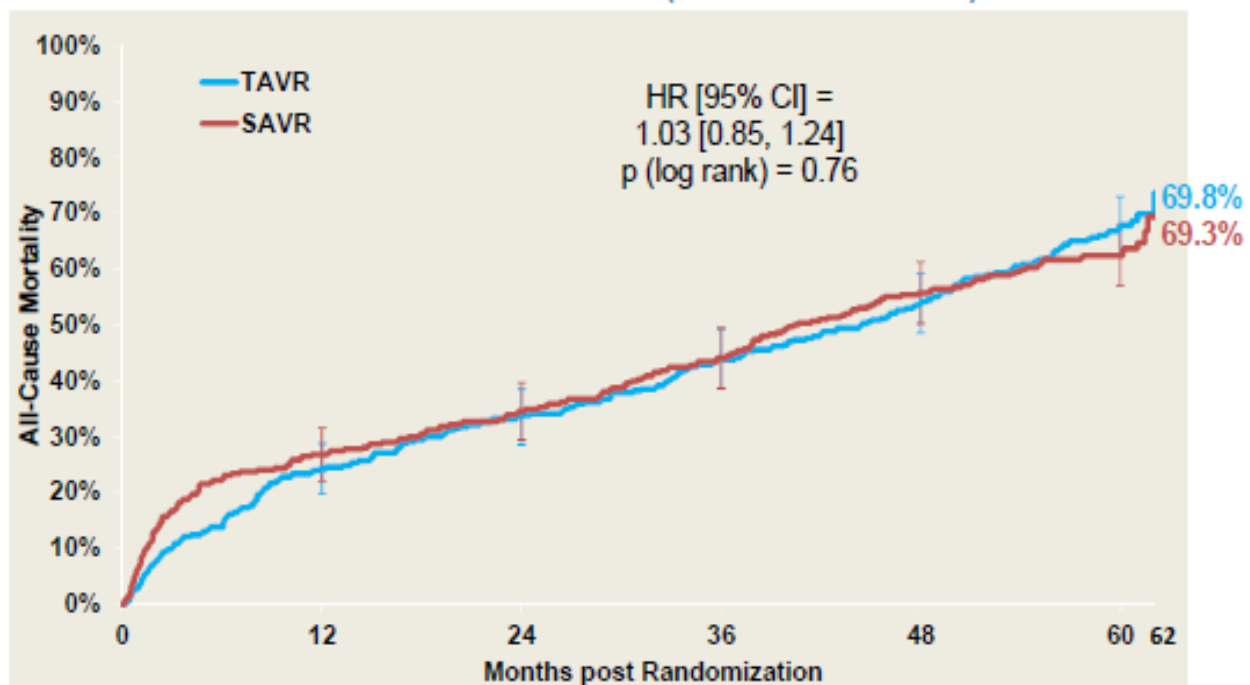

\*\* Only 1 standard Rx patient was alive at 5 years who didn't crossover to TAVR or had SAVR (out of protocol)

# TAVR is Equivalent to Surgery

## PARTNER Cohort A (TAVR vs. SAVR)

TAVR	348	262	228	191	154	61	8
SAVR	351	236	210	174	131	64	8

## Key Facts About PARTNER Trial

- ① Trial started in 2007 - <100 TAVRs done in US
- ② Only 6 of the 25 sites had experience with TAVR before PARTNER trial
- ③ Outcomes of TAVR compared with SAVR in arguably the best surgical centers in the country
- ④ 22F and 24F devices for transfemoral approach (40% not eligible for TF)
- ⑤ Retroflex 1 device used for majority of cases

### Resumo

**Fundamento:** O implante de válvula aórtica por cateter tornou-se uma opção para pacientes com doença valvar aórtica de elevado risco cirúrgico.

**Objetivo:** Avaliar os resultados dos seguimentos intra-hospitalar e de até 1 ano do implante de válvula aórtica por cateter.

**Métodos:** Estudo de coorte prospectiva de casos de implante de válvula aórtica por cateter entre julho de 2009 e fevereiro de 2015. Análise de variáveis clínicas e do procedimento, correlacionando com mortalidade intra-hospitalar e de 1 ano.

**Resultados:** Foram submetidos ao implante 136 pacientes, com média de idade de 83 (80-87) anos, sendo 49% mulheres, 131 (96,3%) deles com estenose aórtica, um (0,7%) com insuficiência aórtica e quatro (2,9%) com disfunção de prótese. A classe funcional da NYHA foi III ou IV em 129 (94,8%) casos. A área valvar inicial foi  $0,67 \pm 0,17$  cm<sup>2</sup> e o gradiente ventrículo esquerdo-aorta médio de  $47,3 \pm 18,2$  mmHg, com STS de 9,3% (4,8%-22,3%). As próteses implantadas eram autoexpansíveis em 97% dos casos. A mortalidade peroperatória em 1,5% dos casos; em 30 dias em 5,9%; intra-hospitalar em 8,1%; e após 1 ano em 15,5% dos casos. A hemotransfusão (risco relativo de 5,4;  $p = 0,0003$ ) e a hipertensão arterial pulmonar (risco relativo de 5,3;  $p = 0,036$ ) foram preditoras de mortalidade hospitalar; e a proteína C-reativa pico (risco relativo de 1,8;  $p = 0,013$ ) e a hemotransfusão (risco relativo de 8,3;  $p = 0,0009$ ) de mortalidade em 1 ano. Aos 30 dias, 37% dos pacientes estavam em classe NYHA I/II e, em 1 ano, o número chegou a 96%.

**Conclusão:** O implante de válvula aórtica por cateter foi realizado com alto índice de sucesso e baixa mortalidade. A hemotransfusão associou-se com maior mortalidade hospitalar e de 1 ano. Proteína C-reativa pico se associou com a mortalidade de 1 ano. (Arq Bras Cardiol. 2016; 106(6):519-527)

# TAVR

## *Current Reality*

- TAVR works!!!
- Patients (and physicians) want a less invasive therapy
- Risk/benefit thresholds vary with age

TAVR has been integrated into treatment algorithm and will continue to move into lower risk patient population

Rio 2016
