AIDA STEMI CMR Substudy

- CMR enables investigation of mechanistic and pathophysiological effects of intracoronary + intravenous abciximab application on myocardial damage and reperfusion injury.

- To determine potential benefits of intracoronary abciximab application on infarct size, myocardial salvage, microvascular obstruction and ventricular function to further evaluate the benefit with respect to congestive heart failure.

Summary + Conclusions

- This largest multicenter CMR study in STEMI patients to date demonstrates that IC as compared to IV abciximab did not result in a difference in myocardial damage and/or reperfusion injury.

- The results of the AIDA STEMI CMR substudy therefore confirm the lack of difference in the combined endpoint of death, reinfarction or congestive heart failure of the AIDA STEMI trial.
